MX2

Born to drive machines
Model: MX2
200 V Class Three-Phase Input 0.1 to 15 kW
200 V Class Single-Phase Input 0.1 to 2.2 kW
400 V Class Three-Phase Input 0.4 to 15 kW

QUICK START GUIDE

MX2 Quick Start Guide

MX2 Quick Start Guide

1 SPECIFICATIONS

1.1 Upon receipt

Please perform the following task after receiving the drive:

- Inspect the driver for damage. If the drive appears to be damaged upon receipt, contact your supplier
- Verify the receipt of the correct model by checking the information on the nameplate. If you have received the wrong model contact your supplier.
- Refer to the User's Manual for detailed information about the product and functions

Basic specifications and EMC filter

Voltage	Type		HD (150% overload for 60s)		ND (120% overload for 60s)		EMC filter*

* 3G3MX2-D types include a built in EMC filter

1.2 Technical specification

	Model number MX2	Specifications
Control functions	Control methods	Phase-to-phase sinusoidal pulse with modulation PWM (Sensorless vector control, V/F)
	Output frequency range	0.10..1000.00 Hz (with restrictions above 400Hz)
	Frequency precision	Digital set value: ±0.01% of the max. frequency
		Analogue set value: ±0.2% of the max. frequency (25 ±10 ºC)
	Resolution of frequency set value	Digital set value: 0.01 Hz
		Analogue set value: 1/1000 of maximum frequency
	Resolution of output frequency	0.01Hz
	Starting torque	200% / 0.5Hz
	Overload capability	Dual rating: Heavy duty (CT): 150% for 1 minute / Normal Duty (VT): 120% for 1 minute
	Frequency set value	0 to 10 VDC (10KW), 4 to 20mA (100W), RS485 Modbus, Network options
	V/f Characteristics	Constant/ reduced torque, free V/f
Functionality	Analogue inputs	2 analogue inputs 0 to 10V (10KW), 4 to 20mA (100W)
	Pulse train input terminal	0 to 10V (up to 24V), up to 32KHz
	Accel/Decel times	0.01 to 3600.0s (line/curve selection), 2nd accel/decel setting available
	Display	Status indicator LED's Run, Program, Alarm, Power, Hz, Amps
Protection functions	Motor overload protection	Electronic Thermal overload relay and PTC thermistor input
	Instantaneous overcurrent	200% of rated current
	Overload	Dual rating: Heavy duty (CT): 150% for 1 minute / Normal Duty (VT): 120% for 1 minute
	Overvoltage	800V for 400V type and 400V for 200V type
	Undervoltage	345V for 400V type and 172.5V for 200V type
	Momentary power loss	Following items are selectable: Alarm, decelerates to stop, decelerates to stop with DC bus controlled, restart
	Cooling fin overheat	Temperature monitor and error detection
	Stall prevention level	Stall prevention during acceleration/deceleration and constant speed
	Ground fault	Detection at power-on
Ambient conditions	Degree of protection	IP20, Varnish coating on PCB & IP54 (For 3G3MX2-D☐ type)
	Ambient humidity	90% RH or less (without condensation)
	Storage temperature	-20 ºC..+65 ºC (short-term temperature during transportation)
	Ambient temperature	-10°C to 50°C (Output current derating could be necessary above 40ºC or depending on installation conditions)
	Installation	Indoor (no corrosive gas, dust, etc.)
	Installation height	Max. 1000 m
	Vibration	5.9 m/s^2 (0.6G), 10 to 55 Hz

2.3 Installation Environment clearance

100 mm or more

Air flow

Inverter

Provide sufficient space so that the top and bottom wiring ducts, etc. will not obstruct the flows of cooling air.

Wall

50 mm or more   50 mm or more   100 mm or more
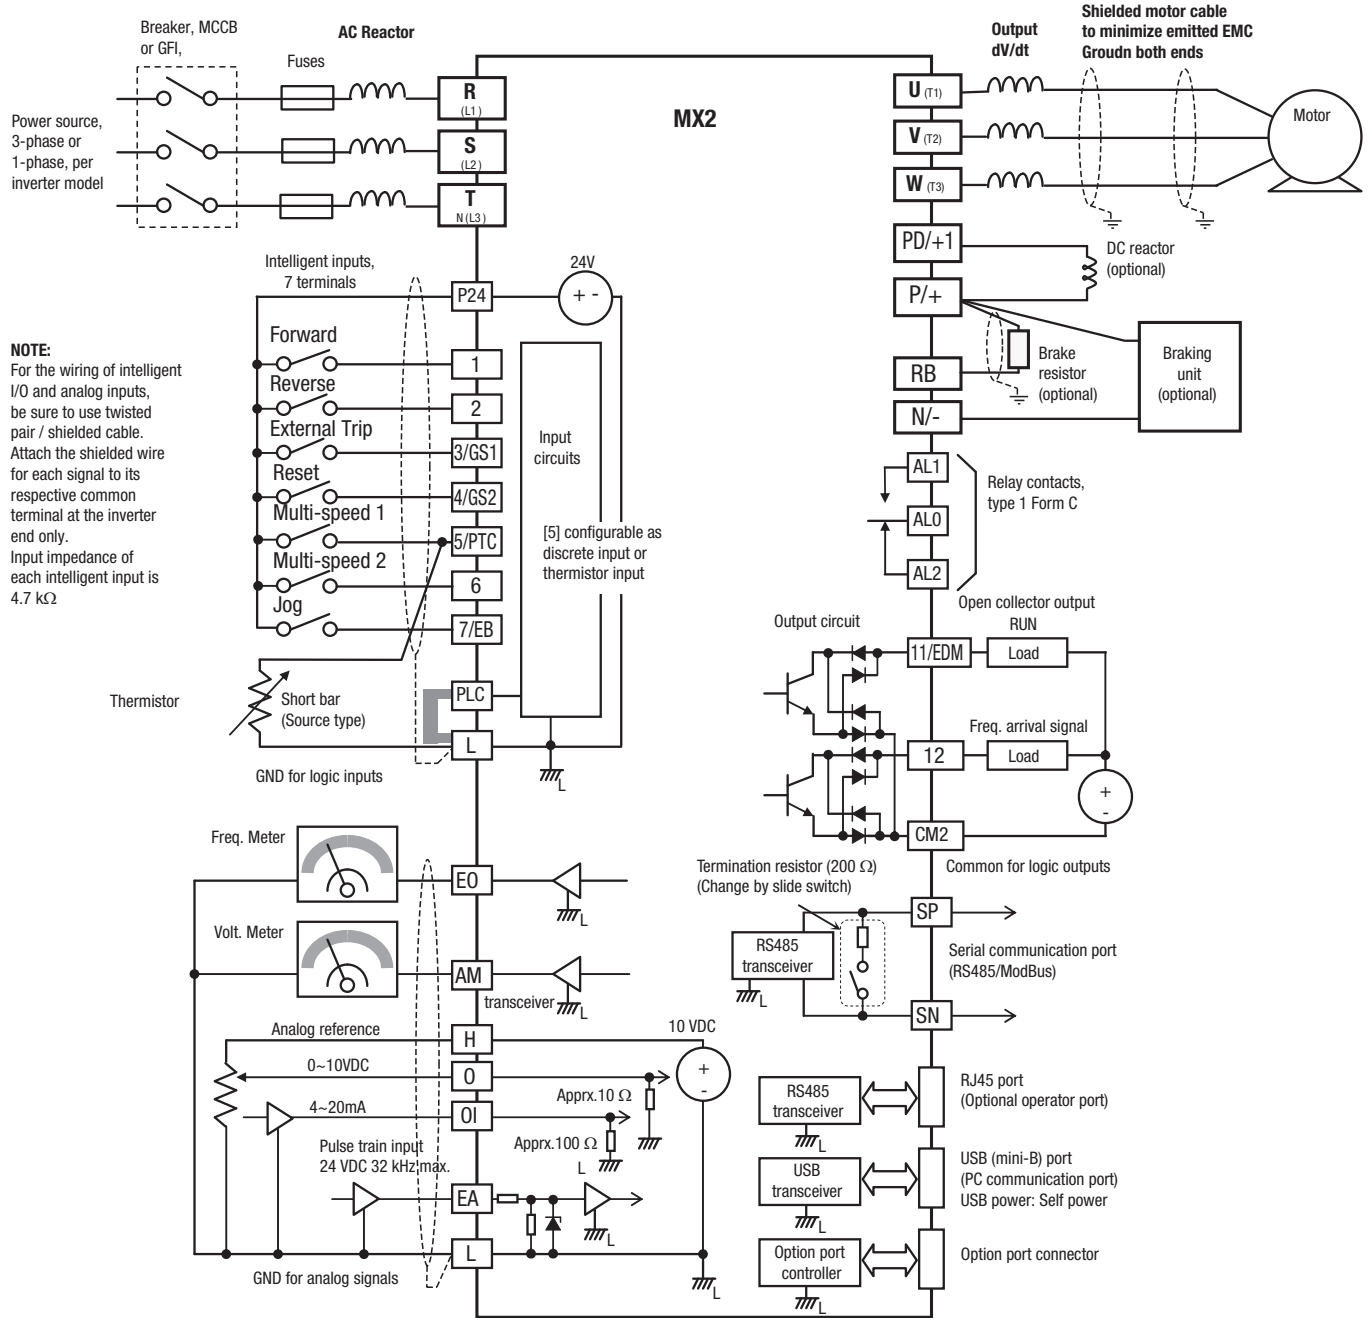

Side by side installation is possible but ambient temperature should not exceed 40ºC and for some cases carrier frequency and output current should be derated. Please refer to MX2 user's manuals for details.
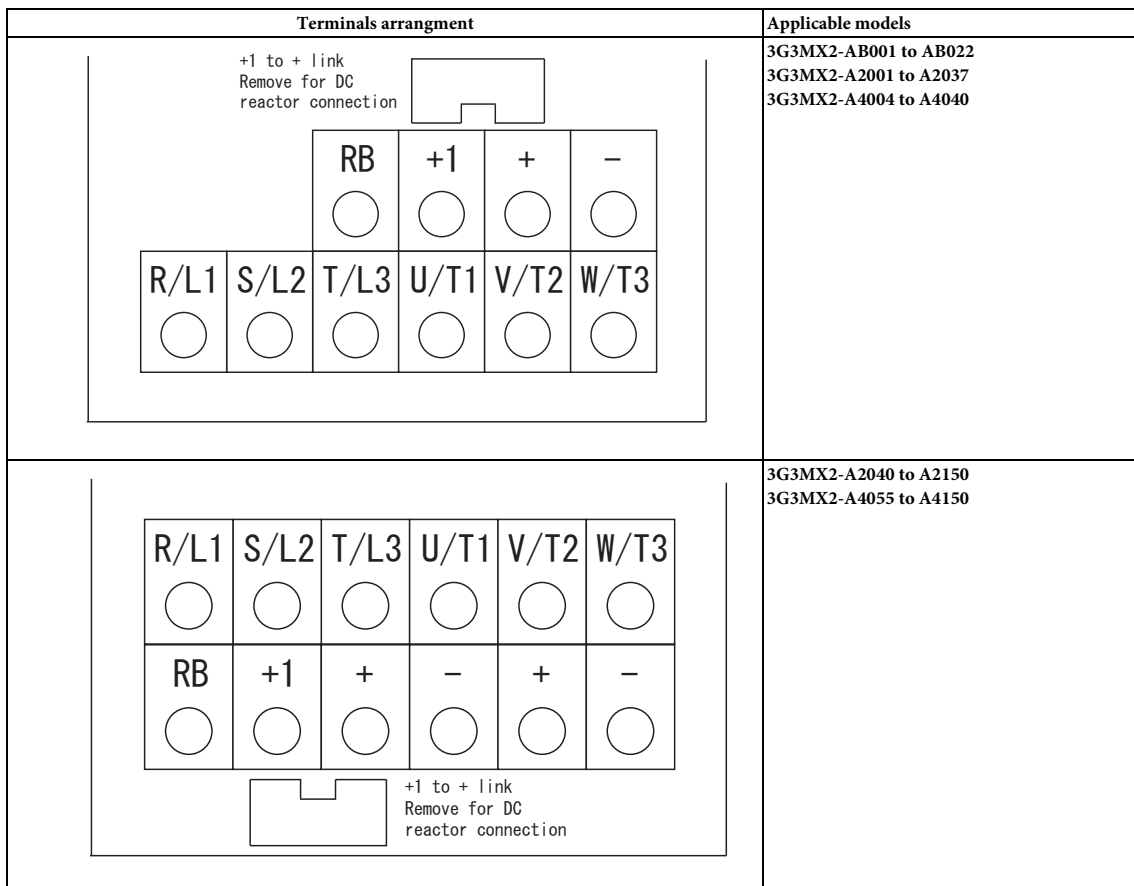

2.4 Wiring overview

2.5 Power wiring

| Terminal name	Purpose	Details
R, S, T (L1, L2, L3)	Main circuit, power supply	Single phase 200-240V (Connect to L1 and N terminals) Three phase 200-240V Three phase 380-480V
U, V, W (T1, T2, T3)	Motor output	Three phase motor connection (IM, PM)
+1, +	DC reactor	Remove the link and install DC reactor for improvement of harmonics level and power factor
RB	Extrenal brake resistor	An external braking resistor is connected.
+, -	Regeneration braking unit	For connection of external regeneration braking unit
G ⏚	Earth	Earthing terminal.

Terminals arrangment	Applicable models

Type		Terminal Name	Purpose	Details	Electrical specifications
Digital	Power supply	P24	+24 V for logic inputs	24VDC power supply for the DI When source logic is selected, it becomes the common point of input (do not short to terminal L)	Max 100mA including DI (5mA each)
		PLC	Intelligent input common	This terminal is used as the common terminal of the DI. For internal supply (and voltage-free contacts): Short between P24 and PLC: Sink logic (the current will flow from the MX2 input to the output) Short between CM1 and PLC: Source logic (the current will flow from the output to the MX2 input)	
		L (upper row)	GND for logic inputs	Sum of input [1]~[7] currents (return)	
	Input	1 2 3/GS1 4/GS2 5/PTC 6 7/EB	Discrete logic inputs (Terminal [3],[4],[5] and [7] have dual function)	It is possible to allocate any of the digital multifunction inputs to this terminals. When safety function is enable by hardware dip-switch multifunction setting **77:GS1** amd **78:GS2** are compulsory for terminals 3 and 4 and functionality change based on ISO13849-1 For **PTC** connect the motor thermistor between terminals 5 and L and assign **19:PTC** on parameter C005. Inverter will trip when thermistor exceed 3kOhm. For pulse train input B set **85:EB** in C007 parameter. Max freq for this terminal is 2kHz.	ON voltage: 18V min OFF voltage: 3V max Max.voltage: 27 VDC Load current: 5mA at 24V
		EA	Pulse train input A	32 kHz max. Common is [L]	
	Output	11/EDM	Discrete logic outputs [11] (Terminal [11] has dual function. Selected by hardware switch)	Any multifunction output signal can be set to this terminals. In case the EDM is selected, the functionality is based on ISO13849-1	50mA max. ON state current, 27 VDC max. OFF voltage
		12	Discrete logic outputs [12]	50 mA max. ON state current, 27 VDC max. OFF state voltage Common is CM2	
		CM2	GND for logic output	100 mA: [11], [12] current return	
		EO	Pulse train output	10 VDC 32 kHz maximum	2mA maximum
		AL0	Relay common contact	Any multifunction output signal can be set to this terminals.	250 VAC 2.5 A(R load) max. 250 VAC 0.2 A (I load,P.F.=0.4) 100 VAC 10 mA min. 30 VDC 3.0 A(R load) max. 30 VDC 0.7 A(I load, P.F.=0.4) 5 VDC 100 mA min
		AL1	Relay contact, normally open		
		AL2	Relay contact, normally closed		
Analogue	Output	AM	Analog voltage output	0~10 VDC	1 mA maximum
	Input	OI	Analog current input	4 to 19.6 mA range, 20 mA nominal,	input impedance 100 W
		O	Analog voltage input	0 to 9.8 VDC range, 10 VDC nominal,	input impedance 10 KW
	Power supply	H	+10 V analog reference	.	10 VDC nominal, 10 mA max
		L (bottom row)	GND for analog signals	Sum of [OI], [O], and [H] currents (return)	

2.7 Screwless terminals connection
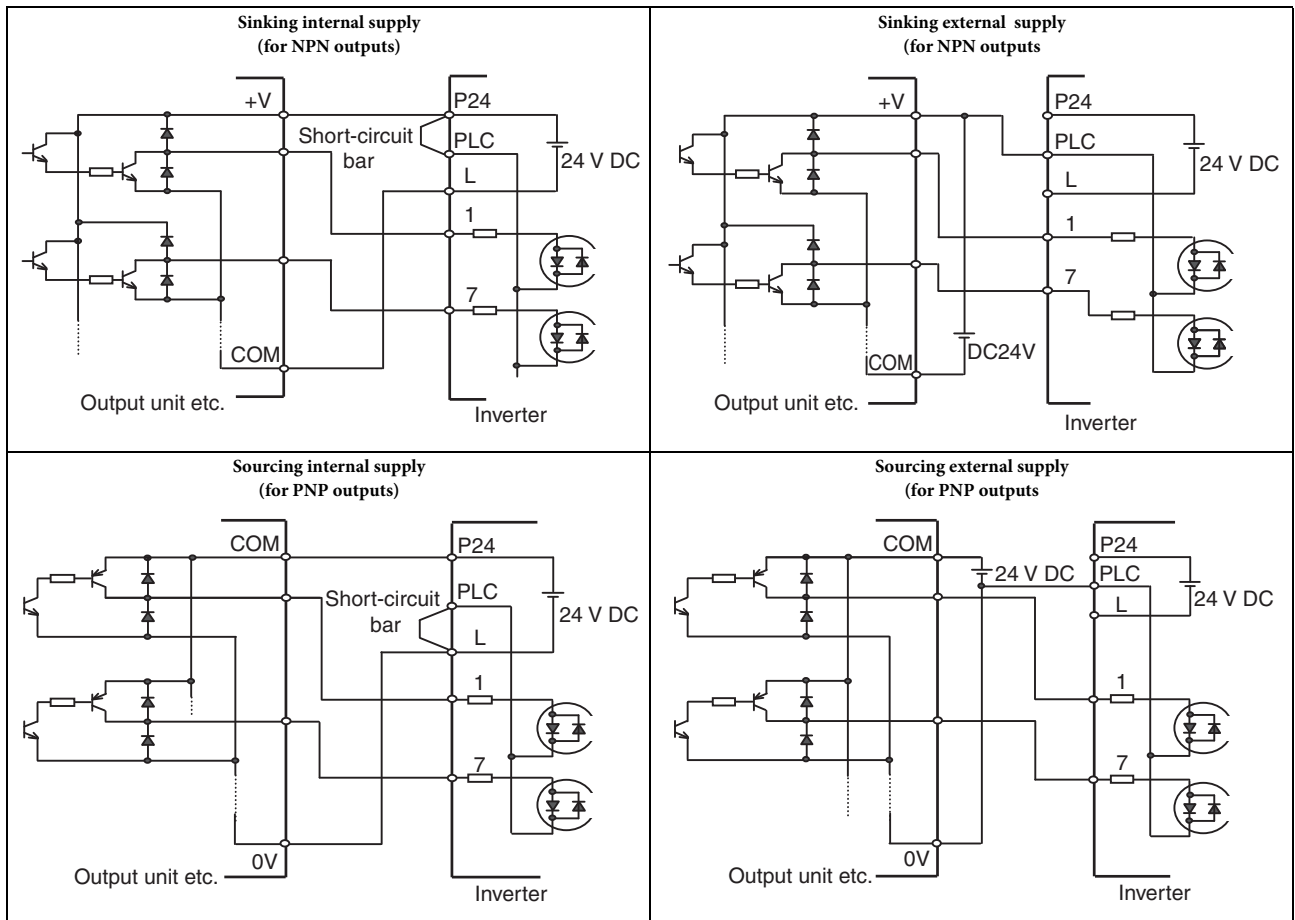

To connect cable, just push the terminal into position

To release cable, press the orange tab with small screwdriver and remove the cable

2.5 mm

Push the screwdriver   Pull out the cable   Release the screwdriver
2.8 Digital inputs SINK/SOURCE (NPN/PNP) settings

2.9 Safe stop disable function

MX2 inverter incorporates a SAFE STOP function at hardware level according with EN60204-1 stop category 0. It is designed to meet the requirements of the ISO13849-1, PL=d and IEC61508 SIL 2 only in a system in which EDM signal is monitored by an "external device monitor". Two redundant inputs are required (3/GS1 and 4/GS2). The function is purely hardware based. but to activate it you should set below switches to ON. This will fix the configuration of multi-function inputs 3 (C003=77) and 4 (C004=78) and also for the multi-function output 11 (C021=62).
When the switches are set to OFF the multi-function input and output the configuration is set to No function selection
3 PROGRAMMING MX2

3.1 Digital operator

The display is used in programming the inverter's parameters, as well as monitoring specific parameter values during operation

Items	Contents
(1) POWER LED	Turns ON (Green) while the inverter is powered up.
(2) ALARM LED	Turns ON (Red) when the inverter trips.
(3) Program LED	Turns ON (Green) when the display shows changeable parameter.
	Blinks when there is a mismatch in setting.
(4) RUN LED	Turns ON (Green) when the inverter is driving the motor.
(5) Monitor LED [Hz]	Turns ON (Green) when the displayed data is frequency related.
(6) Monitor LED [A]	Turns ON (Green) when the displayed data is current related.
(7) Run command LED	Turns ON (Green) when a Run command is set to the operator. (Run key is effective.)
(8) 7-seg LED	Shows each parameter, monitors etc.
(9) Run key	Makes inverter run.
(10) Stop/reset key	Makes inverter decelerates to a stop.
	Reset the inverter when it is in trip situation
(11) CYCLE key	Go to the top of next function group, when a function mode is shown
	Cancel the setting and return to the function code, when a data is shown
	Moves the cursor to a digit left, when it is in digit-to-digit setting mode
	Pressing for 1 second leads to display data of $d001$, regardless of current display.
(12) Up key	Increase or decrease the data.
(13) Down key	Pressing the both keys at the same time gives you the digit-to-digit edit.
(14) SET key	Go to the data display mode when a function code is shown
	Stores the data and go back to show the function code, when data is shown.
	Moves the cursor to a digit right, when it is in digit-to-digit display mode
(15) USB connector	Connect USB connector (mini-B) for using PC communication
(16) RJ45 connector	Connect RJ45 jack for remote operator

3.2 Keypad navigation
Pressing at the same time the up and down key in function code or data display will enable the single-digit edit mode that allows a faster navigation, refer to the manual for more details.

3.3 Initialization

You can restore all inverter parameters to the original factory (default) settings according to area of use. After initializing the inverter, use the power up test in Chapter 2 to get the motor running again. If operation mode (std. or high frequency) mode is changed, inverter must be initialized to activate new mode. To initialize the inverter, follow the steps below.

- Select initialization mode in b084.

    00 Initialization disable

    01 Clears trip history

    02 Initializes all Parameters

    03 Clears Trip history and initializes all parameters

    04 Clears Trip history and initializes all parameters and drive programming

- If **b084=02, 03** or **04**, select initialization target data in **b094**.

    00 All parameters

    01 All parameters except I/O configuration

    02 Only parameters register in Uxxx

    03 All parameter except the ones registered in Uxxx and b037

- Set **b180=01**

The following display appears for a few seconds, and initialization is completed with **d001** displayed

Display during initialization

Initialization mode	`5 HC`	Initialization of trip history
	`5 00`	Initialization for area A
	`5 01`	Initialization for area B

↖ The left digit rotates during initialization

⇨ `d001`

⇕ Blinking alternately

Operation mode after initialization	`1-C`	HD mode
	`1-u`	ND mode
	`H-1`	High frequency mode

3.4 Inverter modes

Normal mode (∼400 Hz)

HD mode — ND mode

HD mode		ND mode
HD mode b049: 00 d060: 1-C	b049 = 01 → ← b049 = 00	ND mode b049: 01 d060: 1-u

b171 = 02 + init.   b171 = 01 + init.   b171 = 03 + init.   b171 = 01 + init.   b171 = 03 + init.

High freq. mode d060: H-1	b171 = 03 + init. → ← b171 = 02 + init.	Permanent magnet mode d060: P

High freq. (∼1000 Hz)   Permanent magnet mode

Display code	Function name	Setting range/content	Initial value	Remarks
A044	V/f characteristic curve	00: Constant torque	0	For the second motor use parameter A244
		01: Reduced torque		
		02: Free V/F		
		03: Sensorless Vector Control		
b049	Dual rating selection	00: Constant torque 150% overload during 60s	00	Some parameters default and ranges depends off this setting. Refer to below table for details
		01: Variable torque 120% overload during 60s		
b171	Inverter mode selection	00: No function	00	To enable the new mode is necessary to initialize the inverter
		01: Standard Induction Motor		
		02: High Frequency Induction Motor		
		03: Permanent Magnet Motor		
d060	Inverter mode monitor	IM-CT (Induction motor constant torque)	-	Displays the current inverter mode use this one to check configuration as b171 returns to 0 after initialize
		IM-VT(Induction motor variable torque)		
		Hi-IM (High frequency induction motor)		
		PM (Permanent magnet motor)		

Neither the A044 or the b049 needs a initialization but remember to initialize the drive setting b180=01 when the inverter mode is changed on b171.

This table shows the parameters that change with the dual rating selectiong is modified

Name	Func. code	HD		ND	
		Range	initial data	Range	initial data

Motor capacity	H003	0.1 to 15(kW)	Depends on type	0.2 to 18.5(kW)	One size up than HD

3.5 Basic settings

After selecting the inverter mode follow next steps for a basic operation of the inverter

- Select frequency reference source on parameter A001

Parameter nº	Parameter Name	Details
A001	Frequency source	00 Potentiometer of ext. operator
		01 Control terminals
		02 Digital operator (F001)
		03 ModBus Network
		04 Option
		06 Pulse train input
		07 Via Drive programming
		10 Calculate function output

- Select Run command source on parameter A002

Parameter nº	Parameter Name	Details
A002	Run command source	01 Control terminals
		02 Run key on keypad or digital operator
		03 Modbus network input
		04 Option

- Adjust the stopping method by b091 and the acceleration/deceleration ramps on parameters F002 and F003

Parameter	Parameter Name	Details
b091	Stop mode selection	00: Deceleration to stop
		01: Free Run
F002	Acceleration time (1)	0.01 to 3600.00
F003	Deceleration time(1)	0.01 to 3600.00

- Set the motor base frequency and AVR voltage of the motors in parameters A003 and A082

Parameter	Parameter Name	Details
A003	Base Frequency	30.0 to maximum frequency in A004
A082	AVR voltage select	200V: 200 to 240V 400V: 380 to 480V

- Set the motor data: rated current (b012), rated power (H003) and number of poles (H004)

Parameter	Parameter Name	Details
b012	Level of electronic thermal	20% to 100% of inverter rated current
H003	Motor capacity	0.1 to 18.5KW
H004	Motor poles settings	2 to 48 poles

- When working in sensorless vector control perform motor auto tuning by parameter H001 (see next section for details)

At this point the inverter is ready to run the motor for the first time, but first review this check-list:

- Verify the power LED is ON. If not, check the power connections.
- Verify the PRG LED is OFF. If it is ON, review the instructions above.
- Make sure the motor is disconnected from any mechanical load.
- Make sure that you have a frequency reference checking the content of F001 and the Hz Led on operator
- Now give the RUN command from the selected source. The RUN LED will turn ON.
- The motor should start turning.
- Remove the RUN command or press the STOP key to stop the motor rotation.

3.6 Auto tuning (SLV Mode)

The MX2 inverter has auto-tuning function to get suitable motor control performance by measuring the motor constants automatically. Auto-tuning is effective only for sensorless vector control. Basically two modes are available the static and the rotative one:

- Static is less accurate but it could be used in situations where motor rotation could damage the mechanics. For this mode neither the I0 (no-load current) or the J (inertia) are calculated.
- Rotative auto-tuning moves the motor following a special operation pattern to find the motor characteristics. However, the torque during auto-tuning is not sufficient so is recommended to detach the mechanical system and don't use for example with vertical loads.

The Auto-tuning mode is selected by parameter H001 and after it finish succefully is necessary to to select the auto-tuning parameters by parameter H002.

Parameter	Parameter Name	Description
H001	Auto-tuning selection	00: Disable
		01: Enabled with motor stop
		02: Enabled with motor rotation
H002	Motor constant selection	00: Standard motor
		02: Auto tuned data

For a correct auto-tuning calculation please take into account following recommendations before starting:

- Use only a motor of the same size or one size lower than the inverter.
- Be sure to disable the DC braking setting (A051=00)
- Be sure to deactivate ATR digital input (52: Enable torque cmd. input)
- Motor rotates up to 80% of base frequency, check if it's a problem for the application.
- Motor should not be driven by any other external force.
- All the brakes should be released
- Be sure that physical limtis of the machine will not be reach
- Even for none-rotative auto-tuning there is a risk that motor moves slightly

After checking the above points and setting parameter H001 procced with the activation of the Run command from the source selected on A002 and the auto-tuning will start. Please check the diagram on next page for detailed information of all the steps.

After the tuning the H001 returns to "00" status and the motor characteristics are transferred to those parameter, remember to set H002 to use them.

Parameter	Parameter Name	Description
H030	Motor constant R1	0.001 to 65.535 Ohms
H031	Motor constant R2	0.001 to 65.535 Ohms
H032	Motor constant L	0.01 to 655.35 mH
H033	Motor constant I0	0.01 to 655.35 A
H034	Motor constant J	0.001 to 9999 kgm2

Note: In case rotary tuning is not possible or autotuning results in very high No Load current (H033) (this is possible with small motors), please use this formula to calculate theoretical value:

H033 = Inom * sin (arccos(cos phi)).

Next diagram shows the auto-tuning procedure with motor rotation

**Step 1:** Set motor size and motor poles

| H003 | Motor size |
| H004 | Motor poles |

Step 2: Set base freq. and AVR voltage

| A003 | Base freq. |
| A082 | AVR voltage |

Step 3: Enable auto-tuning

H001 → 02 ↵

Step 4: Start the inverter according to RUN cmd source

RUN

Auto-tuning starts

Result is displayed

| ---0 | Completed |
| ---9 | Failed |

Step 5: Clear display by STOP key

STOP RESET

Step 6: Activate motor constant by H002

H002 → 02 ↵

When RUN cmd. is given, the motor runs according to following steps.

(1) 1st AC excitation (no rotation)

(2) 2nd AC excitation (no rotation)

(3) 1st DC excitation (no rotation)

(4) V/f operation (80% of base freq.)

(5) SLV operation (X % of base freq.)

(6) 2nd DC excitation (no rotation)

(7) Displays the result.

(Note 1)

A fine tuning could be achived setting parameter H005 that adjust the motor speed response. If the motor vibrates at constant speed then you should reduce the H005 setting, if on the contrary the response of the motor is not enough you could increase the value.

The H005 acts as a global gain response but also is possible to adjust the motor response at certain areas adjusting the motor parameters separately.

- The R1 parameter is adjusting the voltage applied at low speed, below 15-20Hz
- No load current I0 is used for adjusting the voltage above this 15-20Hz
- Finally R2 value is used to adjust the slip of the motor
3.7 Ramps adjustment

The basic frequency (speed) profile is defined by parameters contained in the "F" Group as shown to the right. The set running frequency is in Hz, but acceleration and deceleration are specified in the time duration of the ramp (from zero to maximum frequency, or from maximum frequency to zero).

Acceleration 1 and Deceleration 1 are the standard default accel and decel values for the main profile. Accel and decel values for an alternative profile are specified by using parameters `A092` through `A093`.

Acceleration and deceleration can be set via Drive programming as well via parameter P031
Parameter	Parameter Name	Description
A004	Maximum frequency	30.0 to 400.0Hz
b082	Start frequency	0.01 to 9.99Hz
F001	Output frequency setting	0.00 to 400.00Hz
F002	Acceleration time(1)	0.01 to 3600.00s
F003	Deceleration time(1)	0.01 to 3600.00s
P031	Accel/Decel setting source selection	00: Via operator
		01: Via Drive Programming

Standard acceleration and deceleration is linear. The inverter CPU can also calculate an S-curve acceleration or deceleration curve as shown. This profile is useful for favoring the load characteristics in particular applications. Even if the shape of the ramps change the time keeps being the same one set in F002/F003

Curve settings for acceleration and deceleration are indepenently selected. To enable the S-curve, use function **A097** (acceleration) and **A098** (deceleration).
Parameter	Parameter Name	Description
A097	Acceleration curve selection	00: Linear curve
		01: S-curve
A098	Deceleration curve selection	02: U-curve
		03: Inverse U-curve
		04: EL-S curve
A131	Acceleration curve constant	Range is 01 to 10.
A132	Deceleration curve constant	Range is 01 to 10.
A150	Curvature of EL-S-curve at the start of acceleration	Range is 0 to 50%
A151	Curvature of EL-S-curve at the end of acceleration	Range is 0 to 50%
A152	Curvature of EL-S-curve at the start of deceleration	Range is 0 to 50%
A153	Curvature of EL-S-curve at the end of deceleration	Range is 0 to 50%

This table shows the different acceleration shapes

| Setting	00	01	02	03	04
Curve	Linear	S-curve	U-curve	Inverse U-curve	EL S-curve
A097 (Accel. pattern) A098 (Decel. pattern)	Freq.	Freq.	Freq.	Freq.	Freq.

3.8 DC Braking

The DC braking feature can provide additional stopping torque during deceleration or before acceleration and is particulary useful at low speeds when normal deceleration torque is minimal. This function injects a DC voltage into the motor windings which generates a DC current that force the motor to stop.

There are several modes available depending on the application requirements:

- Normal DC braking is used when A051 is set to "01" (Enable during stop) and the RUN command (FW/RV) is turned OFF, at the moment that deceleration stops the DC brake starts with a settable power (A054) and duration (A055). Additionally is possible to specify a wait time between the end of the ramp and the DC braking on parameter A053, during which the motor will free run. If free-run is selected as stopping method the DC braking will start just when the Run commands turns OFF.

DC Brake at stop
- DC braking by frequency detection can be selected setting a051 to "02" (Frequency detection). In this case DC braking operates when the output frequency comes down to the one you specified in A052 while the RUN command is still active. External DB and internal DC braking are invalid during the frequency detection mode.

Eample 1: Step change in F-SET
Example 2: Analog change in F-SET

- Last option is to trigger the DC injection by a digital input when the terminal (DB) is turned ON. Set parameters A053 and A054 to setup this function. There are several cases depending on the motor rotation and Run command status.

FW or RV DI are ON **Run from operator** **Run from operator with delay**

DC braking at startup is also possible by independent setup of parameters A057 and A058. This is useful in aplications were load should be totally stopped before starting the movement.

| Parameter	Parameter Name	Description
A051	DC braking enable	Three options; select codes: 00... Disable 01... Enable during stop 02... Frequency detection
A052	DC braking frequency	The frequency at which DC braking begins, range is from the start frequency (B082) to 60Hz
A053	DC braking wait time	The delay from the end of controlled deceleration to start of DC braking (motor free runs until DC braking begins), range is 0.0 to 5.0 sec.
A054	DC braking force for deceleration	Level of DC braking force, settable from 0 to 100%
A055	DC braking time for deceleration	Sets the duration for DC braking, range is from 0.0 to 60.0 seconds
A056	DC braking / edge or level detection for [DB] input	Two options; select codes: 00... Edge detection 01... Level detection
A057	DC braking force at start	Level of DC braking force at start, settable from 0 to 100%
A058	DC braking time at start	Sets the duration for DC braking, range is from 0.0 to 60.0 seconds
A059	Carrier frequency during DC braking	Carrier frequency of DC braking performance, range is from 2.0 to 15.0 kHz

Be careful to avoid specifying to long braking time or to hihg carrier frequency that can cause motor overheating. If you use DC braking is recommended to use motors with a built-in thermistor and wire it to inverter's thermistor input.

3.9 V/F Curve

The inverter generates the motor output according to the V/f algorithm selected on parameter A044. The factory default is Constant torque ("00"). Review the following description to help you choose the best torque control algorithm for your application.

Review following description to help you choose the best torque control algorithm for your application:.

- **Constant and Variable (Reduced) Torque** - The graph at right shows the constant torque characteristic from 0 Hz to the base frequency **A003**. The voltage remains constant for output frequencies higher than the base frequency.

- **Variable torque** - The graph at right shows the variable (reduced) torque curve, which has a constant torque characteristic from 0 Hz to 10% of the base frequency. This helps to achieve higher torque at low speed with reduced torque curve at higher speeds.

- **Sensorless Vector Control** - You can achieve high torque performance (200% torque at 0.5 Hz of output frequency) without motor speed feedback but a god tuning of the motor is necessary to do it. Please remember to perform auto-tuning for this control method. (A044="3")

- **Free V/F Control** - The free V/F setting function allows you to set an arbitrary V/F characteristics by specifying the voltages and frequencies (**b100~b113**) for seven points on the V/F characteristic curve (A044="2")
This table shows the details about the Free V/F control

| Parameter	Parameter Name	Diagram	Range
b100	Free-setting V/F freq(1)		0 to b102(Hz)
b101	Free-setting V/F volt (1)		0.0 to 800.0(V)
b102	Free-setting V/F freq(2)		b100 to b104(Hz)
b103	Free-setting V/F volt (2)		0.0 to 800.0(V)
b104	Free-setting V/F freq(3)		b102 to b106(Hz)
b105	Free-setting V/F volt (3)		0.0 to 800.0(V)
b106	Free-setting V/F freq(4)		b104 to b108(Hz)
b107	Free-setting V/F volt (4)		0.0 to 800.0(V)
b108	Free-setting V/F freq(5)		b106 to b110(Hz)
b109	Free-setting V/F volt (5)		0.0 to 800.0(V)
b110	Free-setting V/F freq(6)		b108 to b112(Hz)
b111	Free-setting V/F volt (6)		0.0 to 800.0(V)
b112	Free-setting V/F freq(7)		0 to 400.0(Hz)
b113	Free-setting V/F volt (7)		0.0 to 800.0(V)

3.10 Torque boost function

Manual torque boost - Constant and Vairable torque algorithms feature and asjustable torque boost curve that could help during the startup of load with very big inertia or friction. On those cases it may be necessary to increase the low frequency starting torque characteristic by boosting the voltage above the normal V/F ratio. Basically it attempsts to compensate for voltage drop in the motor primary winding in the low speed range.

Be aware that running the motor at a low speed for a long time can cause motor overheating and this is particularly true when manual torque boost is activated and motor doesn't have force ventilation.
Automatic torque boost- Use the voltage compensation (A046) and slip compensation (A047) to obtain a better performance under automatic torque boost mode (A041=01) ajusting the output frequency and output voltage automatically depending on the load. The output voltage due automatic boost is added to the manual torque boost voltage so both should be adjusted.

Parameter	Parameter Name	Description
A041	Torque boost select	Two options: 00... Manual torque boost 01... Automatic torque boost
A042	Manual torque boost value	Can boost starting torque between 0 and 20% above normal V/f curve, range is 0.0 to 20.0%
A043	Manual torque boost frequency	Sets the frequency of the V/f breakpoint for torque boost, range is 0.0 to 50.0%
A044	V/f characteristic curve	00... Constant torque 01... Reduced torque (1.7) 02... Free V/F 03... Sensorless vector (SLV)
A045	V/f gain	Sets voltage gain of the inverter, range is 20. to 100.%
A046	Voltage compensation gain for automatic torque boost	Sets voltage compensation gain under automatic torque boost, range is 0. to 255.
A047	Slip compensation gain for automatic torque boost	Sets slip compensation gain under automatic torque boost, range is 0. to 255.

3.11 Analog inputs

MX2 provides two analog inputs, the input terminal group includes the [L], [OI], [O], and [H] terminals on the control connector, which provide for Voltage [O] or Current [OI] input. All analog input signals must use the analog ground [L].

If you use either the voltage or current analog input, you must select one of them using the logic input terminal function [AT] analog type. Refer to next table for details about the combinations between A005 and [AT] terminal. Remember that you must also set A001=01 to select analog input as the frequency source.

If [AT] function is not assigned to any digital input the inverter recognizes the [AT] as OFF and [O]+[OI] will be used as analog input. In case either (O) or (OI) is to be referred, please ground the other.

A005	[AT] Input	Analog Input Configuration
00	ON	[O]
	OFF	[OI]
02	ON	[O]
	OFF	Integrated POT on external panel
03	ON	[OI]
	OFF	Integrated POT on external panel

For [O] input and using parameters A013 and A014 you could select the portion of the voltage input range. Parameters A011 and A012 select the start and end frequency of the converted output frequency range, respectively. When the line does not begin at the origin (A011 and A013 > 0), then A015 defines whether the inverter outputs 0 Hz or the A011 specified frequency for analog input below A013.

Parameter	Parameter name	Description
A011	[O] start frequency	0.00 to 400.00
A012	[O] end frequency	0.00 to 400.00
A013	[O] start voltage	0. to 100%
A014	[O] end voltage	0. to 100%
A015	[O] start frequency enable	00... Use offset (A011 value) 01.. Use 0Hz
A101	[OI] start frequency	0.00 to 400.00
A102	[OI] end frequency	0.00 to 400.00
A103	[OI] start voltage	0. to 100%
A104	[OI] end voltage	0. to 100%
A105	[OI] start frequency enable	00... Use offset (A101 value) 01.. Use 0Hz
A016	Analog input filter	Range n = 1 to 31, 1 to 30 : ×2ms filter 31: 500ms fixed filter with ±0.1kHz hys.
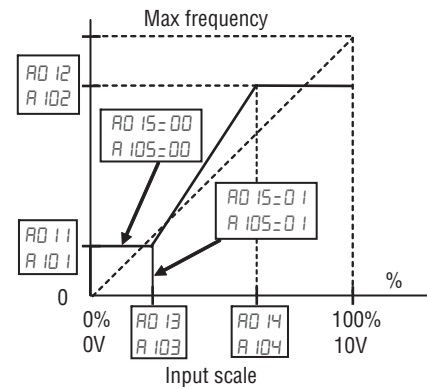

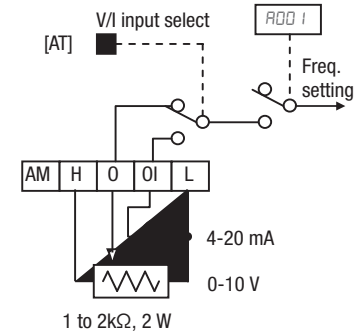

3.12 Digital inputs

The function codes in the following table let you assign between a wide range of functions to any of the seven logic inputs for the MX2 inverter. The functions C001 through C007 configure the terminals [1] through [7] respectively. The "value" of these particular parameters is not a scalar value, but it is a discrete number that selects one option from many available options.

Option Code	Terminal Symbol	Function Name	Description	
**Input Function Summary Table**
00	FW	FORWARD Run/Stop	ON	Inverter is in Run Mode, motor runs forward
			OFF	Inverter is in Stop Mode, motor stops
01	RV	Reverse Run/Stop	ON	Inverter is in Run Mode, motor runs reverse
			OFF	Inverter is in Stop Mode, motor stops
02	CF1	Multi-speed Select, Bit 0 (LSB)	ON	Binary encoded speed selection bit 3 to bit 0
03	CF2	Multi-speed Select, Bit 1		
04	CF3	Multi-speed Select, Bit 2	OFF	
05	CF4	Multi-speed Select, Bit 3 (MSB)		
06	JG	Jogging	ON	Inverter is in Run Mode, output to motor runs at jog parameter frequency
07	DB	External DC braking	ON	DC braking will be applied during deceleration
08	SET	Set (select) 2nd motor Data	ON	The inverter uses 2nd motor parameters for generating frequency output to motor
			OFF	The inverter uses 1st (main) motor parameters for generating frequency output to motor
09	2CH	2-stage Acceleration and Deceleration	ON	Frequency output uses 2nd-stage acceleration and deceleration values
			OFF	Frequency output uses standard acceleration and deceleration values
11	FRS	Free-run Stop	ON	Causes output to turn OFF, allowing motor to free run (coast) to stop
12	EXT	External Trip	ON	When assigned input transitions OFF to ON, inverter latches trip event and displays E 12
			OFF	No trip event for ON to OFF, any recorded trip events remain in history until reset
13	USP	Unattended Start Protection	ON	On powerup, the inverter will not resume a Run command
			OFF	On powerup, the inverter will resume a Run command that was active before power loss
14	CS	Commercial power source switchover	ON	Motor can be driven by commercial power
			OFF	Motor is driven via the inverter
15	SFT	Software Lock	ON	The keypad and remote programming devices are prevented from changing parameters
			OFF	The parameters may be edited and stored
16	AT	Analog Input Voltage/Current Select	ON	Refer to Analog In put selection
			OFF	
18	RS	Reset Inverter	ON	The trip condition is reset, the motor output is turned OFF, and powerup reset is asserted
			OFF	Normal power-ON operation
19	PTC	PTC thermistor Thermal Protection (C005 only)	ANLG	When a thermistor is connected to terminal [5] and [L], the inverter checks for over-temperature and will cause trip event and turn OFF output to motor
			OPEN	A disconnect of the thermistor causes a trip event, and the inverter turns OFF the motor
20	STA	Start (3-wire interface)	ON	Starts the motor rotation
21	STP	Stop (3-wire interface)	ON	Stops the motor rotation
22	F/R	FWD, REV (3-wire interface)	ON	Selects the direction of motor rotation: ON = FWD. While the motor is rotating, a change of F/R will start a deceleration, followed by a change in direction
			OFF	Selects the direction of motor rotation: OFF = REV. While the motor is rotating, a change of F/R will start a deceleration, followed by a change in direction
23	PID	PID Disable	ON	Temporarily disables PID loop control. Inverter output turns OFF as long as PID Enable is active (A071=01)
			OFF	Has no effect on PID loop operation, operates normally if PID Enable is active (A071=01)
24	PIDC	PID Reset	ON	Resets the PID loop controller. Main consequence is that integrator sum is forced to zero
27	UP	Remote Control UP Function (motorized speed pot.)	ON	Accelerates (increases output frequency) motor from current frequency
28	DWN	Remote Control Down Function (motorized speed pot.)	ON	Decelerates (decreases output frequency) motor from current frequency
29	UDC	Remote Control Data Clearing	ON	Clears the UP/DWN frequency memory by forcing it to equal the set frequency parameter F001. Setting C101 must be set=00 to enable this function to work
31	OPE	Operator Control	ON	Forces the source of the output frequency setting A001 and the source of the Run command A002 to be from the digital operator
			OFF	Source of output frequency set by A001 and source of Run command set by A002 is used
32	SF1	Multi-speed Select, Bit 1	ON	Bit encoded speed select, Bit 1 to Bit 7
33	SF2	Multi-speed Select, Bit 2		
34	SF3	Multi-speed Select, Bit 3		
35	SF4	Multi-speed Select, Bit 4	OFF	
36	SF5	Multi-speed Select, Bit 5		
37	SF6	Multi-speed Select, Bit 6		
38	SF7	Multi-speed Select, Bit 7		
39	OLR	Overload Restriction Source Changeover	ON	Perform overload restriction
			OFF	Normal operation

Input Function Summary Table				
Option Code	Terminal Symbol	Function Name		Description
40	TL	Torque Limit Selection	ON	Setting of b040 is enabled
			OFF	Max. torque is limited with 200%
41	TRQ1	Torque limit switch 1	ON	Torque limit related parameters of Powering/regen, and FW/RV modes are selected by the combinations of these inputs.
42	TRQ2	Torque limit switch 2	OFF	
44	BOK	Brake confirmation	ON	Brake confirmation signal received
			OFF	Brake confirmation signal not received
46	LAC	LAD cancellation	ON	Set ramp times are ignored. Inverter output immediately follows the freq. command.
			OFF	Accel. and/or decel. is according to the set ramp time
47	PCLR	Pulse counter clear	ON	Clear the position deviation data
			OFF	Maintain the position deviation data
50	ADD	ADD frequency enable	ON	Adds the A145 (add frequency) value to the output frequency
			OFF	Does not add the A145 value to the output frequency
51	F-TM	Force Terminal Mode	ON	Force inverter to use input terminals for output frequency and Run command sources
			OFF	Source of output frequency set by A001 and source of Run command set by A002 is used
52	ATR	Enable torque command input	ON	Torque control command input is enabled
			OFF	Torque control command input is disabled
53	KHC	Clear watt-hour data	ON	Clear watt-hour data
56	MI1	General purpose input (1)	ON	General purpose input (1) to (7) under Drive programming
57	MI2	General purpose input (2)		
58	MI3	General purpose input (3)		
59	MI4	General purpose input (4)	OFF	
60	MI5	General purpose input (5)		
61	MI6	General purpose input (6)		
62	MI7	General purpose input (7)		
65	AHD	Analog command hold	ON	Analog command is held
			OFF	Analog command is not held
66	CP1	Multistage-position switch (1)	ON	Multistage position commands are set according to the combination of these switches.
67	CP2	Multistage-position switch (2)	OFF	
68	CP3	Multistage-position switch (3)		
69	ORL	Limit signal of homing	ON	Limit signal of homing is ON
70	ORG	Trigger signal of homing	ON	Starts homing operation
73	SPD	Speed/position changeover	ON	Speed control mode
			OFF	Position control mode
77	GS1 *	GS1 input	ON	EN60204-1 related signals: Signal input of "Safe torque off" function.
78	GS2 *	GS2 input	OFF	
81	485	Start EzCOM	ON	Starts EzCOM
			OFF	No execution
82	PRG	Executing Drive programming	ON	Executing Drive program
			OFF	No execution
83	HLD	Retain output frequency	ON	Retain the current output frequency
84	ROK	Permission of Run command	ON	Run command permitted
85	EB	Rotation direction detection (C007 only)	ON	Forward rotation
			OFF	Reverse rotation
86	DISP	Display limitation	ON	Only a parameter configured in b038 is shown
			OFF	All the monitors can be shown
255	no	No function	ON	(input ignored)

All this functions could be assigned to any of the multi-function inputs on parameters C001 to C007, select if the input will be normally open or normally close and the response time of the input.

Parameter	Parameter name	Description
C001	Input [1] function	Select input terminal [1] function
C002	Input [2] function	Select input terminal [2] function
C003	Input [3] function [GS1 assignable]	Select input terminal [3] function
C004	Input [4] function [GS2 assignable]	Select input terminal [4] function
C005	Input [5] function [PTC assignable]	Select input terminal [5] function
C006	Input [6] function	Select input terminal [6] function
C007	Input [7] function	Select input terminal [7] function

Parameter	Parameter name	Description
C011	Input [1] active state	Select logic conversion, two option codes: 00... normally open [NO] 01... normally closed [NC]
C012	Input [2] active state	
C013	Input [3] active state	
C014	Input [4] active state	
C015	Input [5] active state	
C016	Input [6] active state	
C017	Input [7] active state	
C160	Input [1] response time	Sets response time of each input terminal, set range: 0 (x 2 [ms]) to 200 (x 2 [ms])
C161	Input [2] response time	
C162	Input [3] response time	
C163	Input [4] response time	
C164	Input [5] response time	
C165	Input [6] response time	
C166	Input [7] response time	
d005	Intelligent input terminal status	(terminal number display) ON / OFF Terminal numbers

An input terminal configured for option code 18 ([RS] Reset command) cannot be configured for normally closed operation.

3.13 Digital outputs

Function codes in the following table let you assign different options into logical outputs (terminals [11],[12] and [AL]) on parameter C021, C022 and C026..

Input Function Summary Table				
Option Code	Terminal Symbol	Function Name		Description
00	RUN	Run Signal	ON	When the inverter is in Run Mode
01	FA1	Frequency Arrival Type 1- Constant Speed	ON	When output to motor is at the set frequency
			OFF	When output to motor is OFF, or in any acceleration or deceleration ramp
02	FA2	Frequency Arrival Type 2- Over frequency	ON	When output to motor is at or above the set freq., even if in accel (C042) or decel (C043) ramps
			OFF	When output to motor is OFF, or at a level below the set frequency
03	OL	Overload Advance Notice Signal 1	ON	When output current is more than the set threshold (C041) for the overload signal
04	OD	Output Deviation for PID Control	ON	When PID error is more than the set threshold for the deviation signal
05	AL	Alarm Signal	ON	When an alarm signal has occurred and has not been cleared
06	FA3	Frequency Arrival Type 3- Set frequency	ON	When output to motor is at the set frequency, during accel (C042) and decel (C043).
07	OTQ	Over/under Torque Signal	ON	Estimated motor torque exceeds the specified level
09	UV	Undervoltage	ON	Inverter is in Undervoltage
10	TRQ	Torque Limited Signal	ON	Torque limit function is executing
11	RNT	Run Time Expired	ON	Total running time of the inverter exceeds the specified value
12	ONT	Power ON time Expired	ON	Total power ON time of the inverter exceeds the specified value
13	THM	Thermal Warning	ON	Accumulated thermal count exceeds the C061 set value
19	BRK	Brake Release Signal	ON	Output for brake release
20	BER	Brake Error Signal	ON	Brake error has occurred
21	ZS	Zero Hz Speed Signal	ON	Output frequency falls below the threshold specified in C063
22	DSE	Speed Deviation Excessive	ON	Deviation of speed command and actual speed exceeds the specified value P027.
23	POK	Positioning Completion	ON	Positioning is completed
24	FA4	Frequency Arrival Type 4- Over frequency	ON	When output to motor is at or above the set freq., even if in accel (C045) or decel (C046) ramps
25	FA5	Frequency Arrival Type 5- Set frequency	ON	When output to motor is at the set frequency, during accel (C045) and decel (C046).
26	OL2	Overload Advance Notice Signal 2	ON	When output current is more than the set threshold (C111) for the overload signal
27	ODc	Analog Voltage Input Disconnect Detection	ON	When the [O] input value < B070 setting (signal loss detected)
28	OIDc	Analog Current input Disconnect Detection	ON	When the [OI] input value < B071 setting (signal loss detected)

Input Function Summary Table				
Option Code	Terminal Symbol	Function Name	Description	
31	FBV	PID Second Stage Output	ON	Transitions to ON when the inverter is in RUN Mode and the PID Process Variable (PV) is less than the Feedback Low Limit (C053)
			OFF	Transitions to OFF when the PID Process Variable (PV) exceeds the PID High Limit (C052), and transitions to OFF when the inverter goes from Run Mode to Stop Mode
32	NDc	Network Disconnect Detect	ON	When communications watchdog timer (period specified by C077) has time out
33	LOG1	Logic Output Function 1	ON	When the Boolean operation specified by C143 has a logical "1" result
34	LOG2	Logic Output Function 2	ON	When the Boolean operation specified by C146 has a logical "1" result
35	LOG3	Logic Output Function 3	ON	When the Boolean operation specified by C149 has a logical "1" result
39	WAC	Capacitor Life Warning Signal	ON	Lifetime of internal capacitor has expired.
40	WAF	Cooling Fan Warning Signal	ON	Lifetime of cooling fan has expired.
41	FR	Starting Contact Signal	ON	Either FW or RV command is given to the inverter
			OFF	No FW or RV command is given to the inverter, or both are given to the inverter
42	OHF	Heat Sink Overheat Warning	ON	Temperature of the heat sink exceeds a specified value (C064)
43	LOC	Low load detection	ON	Motor current is less than the specified value (C039)
44	MO1	General Output 1	ON	General output 1 is ON (Used by Drive programing)
45	MO2	General Output 2	ON	General output 2 is ON (Used by Drive programing)
46	MO3	General Output 3	ON	General output 3 is ON (Used by Drive programing)
50	IRDY	Inverter Ready Signal	ON	Inverter can receive a run command
51	FWR	Forward Rotation	ON	Inverter is driving the motor in forward direction
52	RVR	Reverse Rotation	ON	Inverter is driving the motor in reverse direction
53	MJA	Major Failure Signal	ON	Inverter is tripping with major failure
54	WCO	Window Comparator for Analog Voltage Input	ON	Analog voltage input value is inside of the window comparator
55	WCOI	Window Comparator for Analog Current Input	ON	Analog current input value is inside of the window comparator
58	FREF	Frequency Command Source	ON	Frequency command is given from the operator
59	REF	Run Command Source	ON	Run command is given from the operator
60	SETM	2nd motor Selection	ON	2nd motor is being selected
62	EDM	STO (Safe Torque Off) Performance Monitor (Output terminal 11 only)	ON	STO is being performed
63	OPO	Option card output	ON	(output terminal for option card)
255	no	Not used	ON	–

In the same way of that the digital inputs is possible to choose between normally close and normally open and even is possible to use some On and Off delay for each of the outputs.

Parameter	Parameter name	Description
C021	Output [11] function [EDM assignable]	Programmable functions available for logic (discrete) outputs transistor type
C022	Output [12] function	
C026	Alarm relay function	Programmable functions available for logic (discrete) outputs relay type
C031	Output [11] active state	Select logic conversion, two option codes: 00... normally open [NO] 01... normally closed [NC]
C032	Output [12] active state	
C036	Alarm relay active state	
C130	Output [11] on delay	Set range is 0.0 to 100.0 sec.
C131	Output [11] off delay	
C132	Output [12] on delay	Set range is 0.0 to 100.0 sec.
C133	Output [12] off delay	
C140	Relay output on delay	Set range is 0.0 to 100.0 sec.
C141	Relay output off delay	
C132	Output [12] on delay	Set range is 0.0 to 100.0 sec.
C133	Output [12] off delay	
d006	Intelligent output terminal status	

3.14 Pulse input

Pulse train input in terminal EA could be used as frequency reference, PID input, encoder feedback for position control and also as an input for Drive Programming. The maximum frequency for this pulse input is 32KHz and the selection is done by parameter P003.

Encoder feedback setting is set in parameter P004, but please remember that this is just for positioning function and close loop vector control can't be performed with MX2 because this encoder reading is not included into the speed loop. For selection "01" and "02" on P004 is possible to use a 2-phase differential encoder but the second channel should be connect to multi-funciton input 7 with the function code "EB".

PNP open collector type or voltage output type encoder

.
Parameter	Parameter name	Description
P003	[EA] terminal selection	00… Speed reference (incl. PID) 01… For control with encoder feedback 02… Extended terminal for EzSQ
P004	Pulse train input mode selection for feedback	Four option codes: 00…Single-phase pulse [EA] 01…2-phase pulse (90° difference) 1 ([EA] and [EB]) 02…2-phase pulse (90° difference) 2 ([EA] and [EB]) 03…Single-phase pulse [EA] and direction signal [EB]
P011	Encoder pulse setting	Sets the pulse number (ppr) of the encoder, set range is 32~1024 pulses
P055	Pulse train input frequency scale setting	Sets the pulse numbers at max. frequency, set range is 1.0~32.0 kHz
P056	Pulse train input frequency filter time constant setting	Set range is 0.01~2.00 sec.
P057	Pulse train input bias setting	Set range is -100~100 %
P058	Limitation of the pulse train input setting	Set range is 0~100 %

The pulse input when used as frequency reference could be adjusted with parameters P055 to P058 according to this diagram
3.15 Analogue and pulse outputs

Several monitors are available through the pulse output [EO] or the analogue output [AM].

| Parameter	Parameter name	Description
C027	[EO] terminal selection (Pulse/PWM output)	00... Output frequency (PWM) 01... Output current (PWM) 02... Output torque (PWM) 03... Output frequency (Pulse train) 04... Output voltage (PWM) 05... Input power (PWM) 06... Electronic thermal load ratio (PWM) 07... LAD frequency (PWM) 08... Output current (Pulse train) 10... Heat sink temperature (PWM) 12... General output (PWM) 15... Pulse train input monitor 16... Option(PWM)
C028	[AM] terminal selection (Analog voltage output 0...10V)	00... Output frequency 01... Output current 02... Output torque 04... Output voltage 05... Input power 06... Electronic thermal load ratio 07... LAD frequency 10... Heat sink temperature 11... Output torque (with code) 13... General output 16... Option
C030	Digital current monitor reference value	Current with digital current monitor output at 1,440Hz Range is 20%~200% of rated current
C047	Pulse train input/output scale conversion	If EO terminal is configured as pulse train input (C027=15), scale conversion is set in C047. Pulse-out = Pulse-in (C047) Set range is 0.01 to 99.99

For the pulse train output there are two types of outputs, code "03", "08" and "15" outputs a pulse train with a 50% duty cycle while the PWM has a fixed frequency of 156.25Hz were the duty cycle is changed depending on the output.

3.16 Torque limit

Torque limit function allows you to limit the motor output when sensorless vector control (SLV) is selected in A044. This function has limited accuracy and repeatability and is realiable only above 15 - 20Hz. You can choose between models using parameter b040.

Quadrant specific setting mode (b040=00) in which individual torque limit value are applied on the four quadrants (forward powering, reverse regeneration..) by torque limits 1 to 4 (b041 to b044)
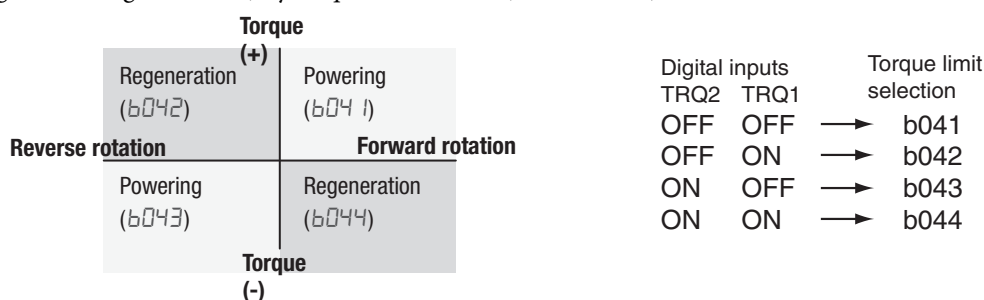

Terminal-switching mode (b040=01) where the torque limit values set in torque limits 1 to 4 (b041 to b044) are switched depending on the combination of the states of the torque limit switch terminals 1 and 2 (TRQ1 and TRQ2) assigned to digital inputs.

Analog voltage input mode (b040=02) where the torque limit value is set by a voltage applied to the terminal O. Range 0 to 10V corresponds with torque limit range between 0 and 200% that is valid for all operating states.

If "TL" torque limit enable functions has been assigned to any of the multi-function inputs the setting of parameter b040 only is valid when this input is ON. No torque limitation will be applied whe the input is OFF.

Parameter	Parameter name	Description
b040	Torque limit selection	00 Quadrant-specific setting mode 01 Terminal-switching mode 02 Analog voltage input mode(O)
b041	Torque limit 1 (fwd/power)	Torque limit level in forward powering quadrant, range is 0 to 200% / no(disabled)

Parameter	Parameter name	Description
b022	Torque limit 2 (rev/regen.)	Torque limit level in reverse regen. quadrant, range is 0 to 200% / no(disabled)
b043	Torque limit 3 (rev/power)	Torque limit level in reverse powering quadrant, range is 0 to 200% / no(disabled)
b044	Torque limit 4 (fwd/regen.)	Torque limit level in forward regen. quadrant, range is 0 to 200% / no(disabled)
b045	Torque LAD STOP selection	00 Disable 01 Enable

100% torque is referred to inverter rated current, absolute torque value is up the motor to be combined.

3.17 Torque control

Torque control in open loop could be achieve with following parameters. 100% torque is referred to inverter rated current but absolute torque value depends on the motor connected. It has limited accuracy and working range so is recomended only above 15 - 20Hz and over 20 - 30% of the motor torque capacity.

Parameter	Parameter name	Description
P033	Torque command input selection	00… Analog voltage input [O] 01… Analog current input [OI] 03… Operator, 06…Option
P034	Torque command level input	Set range is 0~200%
P036	Torque bias mode selection	00… According to the sign 01… According to the rotation direction 05… Option
P037	Torque bias value setting	Range is -200~200%
P038	Torque bias polar selection	00… No bias 01… Operator
P039	Speed limit of Torque control (Forward rotation)	Set range is 0.00~120.00Hz
P040	Speed limit of Torque control (Reverse rotation)	Set range is 0.00~120.00Hz
P041	Speed / Torque control switching time	Set range is 0 to 1000 ms

To enable the torque control is necessary to assign the "ATR" (Enable torque command input) to one of the multi-function inputs and set it to ON. When the input is OFF the inverter will work in speed mode.

At low speed, small torque command or 4 quadrant control applications the perfomance of this function will be limited due the open loop system.

3.18 Electronic thermal overload

The thermal overload detection protects the inverter and motor from overheating due to an excessive load using a current inverse time curve to determine the trip point. The characteristic curve depends on dual rate setting in b049 and is unique for both inverter and motor but reduction rate depending on the frequency could be selected in parameter b013.
b013 could be used to match the torque characteristic with the load. Output current on the winding is used for this calculation as is proportional to the torque generated by the motor. That's why the current level has to be set in parameter b012 with a range that goes from 20 to 100% of the inverter rated current.
Parameter	Parameter name	Description
b012	Level of electronic thermal	Set a level between 20% and 100% for the rated inverter current.
b013	Electronic thermal characteristic	Select from three curves, option codes: 00... Reduced torque 01... Constant torque 02... Free setting
b015	Free setting electronic thermal ~freq.1	Range is 0 to 400 Hz
b016	Free setting electronic thermal ~current1	Range is 0 to inverter rated current Amps
b017	Free setting electronic thermal ~freq.2	Range is 0 to 400 Hz
b018	Free setting electronic thermal ~current2	Range is 0 to inverter rated current Amps
b019	Free setting electronic thermal ~freq.3	Range is 0 to 400 Hz
b020	Free setting electronic thermal ~current3	Range is 0 to inverter rated current Amps

3.19 Carrier frequency (PWM)

The internal switching frequency of the inverter circuitry (also called chopper frequency) defines the IGBT commutation speed that is used to generated the output frequency. Is adjustable from 2.0 to 15KHz (depending on the inverter size) where the audible noise decrease at higher frequencies while the RFI noise and leakage current increase.

The carrier frequency is adjusted by parameter b083 but the activation of the aumatic carrier frequency reduction on parameter b089 could reduce the selected value when the output current increase or when the heat sink temperature is too high. On this way is possible to have a high carrier frequency with light loads and avoid the derating when the load increase. The upper limit is defined by b083 while the lower one is 3KHz with 2KHz per second reduction rate.
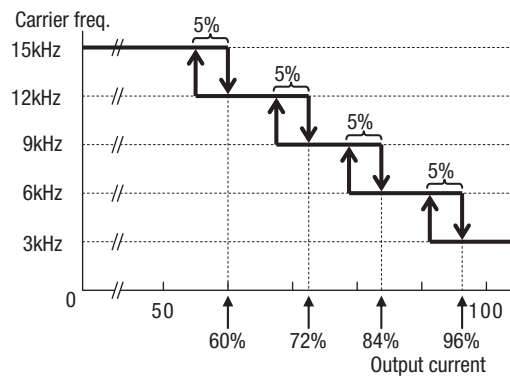

Parameter	Parameter name	Description
b083	Carrier frequency	Sets the PWM carrier (internal switching frequency), range is 2.0 to 15.0 kHz
b089	Automatic carrier frequency reduction	Three option codes: 00 Disabled 01 Enabled, depending on the output current 02 Enabled, depending on the heat-sink temperature

3.20 PID Function

When enabled, the built-in PID loop calculates an ideal inverter output value that cause the loop feedback process variable (PV) to move closer to the set point value (SP). The frequency command is used as SP and the PID loop algorithm will read the analog input for the process variable and calculate the proper inverter output to reach it.
In standard operation, inverter uses a reference source selected by A001 for the output frequency which may be a fixed or variable value. To enable PID operation is necessary to set A071 to "01" and this will cause the inverter to calculate the target frequiency or set point. This presents some advantges like potential energy saving and direct control over the process variable instead of the motor speed.

Parameter	Parameter name	Description
A071	PID enable	00... PID Disable 01... PID Enable 02... PID Enable with reverse output
A072	PID proportional gain	Proportional gain has a range of 0.00 to 25.00
A073	PID integral time constant	Integral time constant has a range of 0.0 to 3600 seconds
A074	PID derivative time constant	Derivative time constant has a range of 0.0 to 100 seconds
A075	PV scale conversion	Process Variable (PV), scale factor (multiplier), range of 0.01 to 99.99
A076	PV source	Selects source of Process Variable (PV), option codes: 00.. [OI] terminal (current in) 01.. [O] terminal (voltage in) 02 .. ModBus network 03.. Pulse train input 10 Calculate function output
A077	Reverse PID action	Two option codes: 00 PID input = SP-PV 01 PID input = -(SP-PV)
A078	PID output limit	Sets the limit of PID output as percent of full scale, range is 0.0 to 100.0%
A079	PID feed forward selection	00... Disabled 01... [O] terminal (voltage in) 02... [OI] terminal (current in)
A156	PID sleep function action threshold	Sets the threshold for the action, set range 0.0~400.0 Hz
A157	PID sleep function action delay time	Sets the delay time for the action, set range 0.0~25.5 sec
A071	PID enable	00... PID Disable 01... PID Enable 02... PID Enable with reverse output

3.21 Current limitation functions

Overload Restriction reduce the output frequency while motoring or increase it during regeneration to restrict the overload when the output current exceeds a certain limit. You can adjust the inverter to apply overload retriction only during constant speed allowing higher currents for acceleration.

Additionally two separate set of parameters are avaiable and is possible to choose between them by intelligent input terminal "39: OLR".
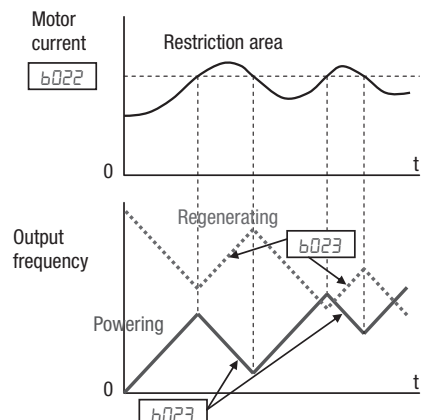

Over-current Trip Suppression function monitors the motor current and actively changes the output frequency profile to keep the motor current below 150% of the motor rated current. Basically the acceleration ramp is at stopped above this current and it only restarts when the current goes below again. It avoids the trip but the total acceleration time could be longer when this function is enable.

Additionally should be considered that this function doesn't operate keeping a constant motor current so is still possible to have an over-current trip during extreme acceleration.
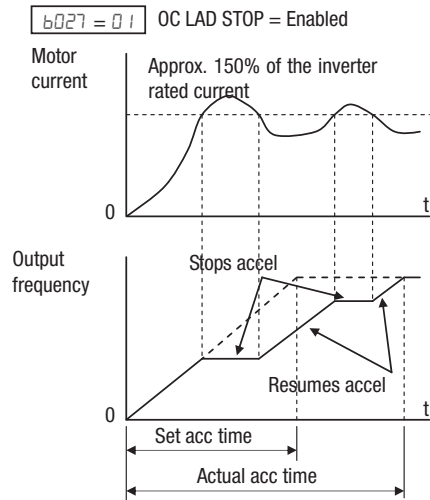

Parameter	Parameter name	Description	
b021	Overload restriction operation mode	00	Disabled
		01	Enabled for acceleration and constant speed
		02	Enabled for constant speed only
		03	Enabled for acceleration and constant speed, increase speed at regen.
b022	Overload restriction level	Sets the level of overload restriction, between 20% and 200% of the rated current of the inverter, setting resolution is 1% of rated current	
b023	Deceleration rate at overload restriction	Sets the deceleration rate when inverter detects overload, range is 0.1 to 3000.0, resolution 0.1	
b024	Overload restriction operation mode 2	00	Disabled
		01	Enabled for acceleration and constant speed
		02	Enabled for constant speed only
		03	Enabled for acceleration and constant speed, increase speed at regen.
b025	Overload restriction level 2	Sets the level of overload restriction, between 20% and 200% of the rated current of the inverter, setting resolution is 1% of rated current	
b026	Deceleration rate 2 at overload restriction	Sets the deceleration rate when inverter detects overload, range is 0.1 to 3000.0, resolution 0.1	
b027	OC suppression selection *	00	Disabled
		01	Enabled

3.22 Overvoltage protection

DC Bus AVR (Automatic Voltage regulation) helps to avoid an overvoltage trip when the DC bus voltage increase due regeneration during deceleration. The function keeps the DC bus voltage stable at certain level regulating the deceleration ramp by a PI function. Please note that the actual deceleration time can be longer in this case.

Parameter	Parameter name	Description
b130	Deceleration overvoltage suppression enable	00 Disabled 01 Enabled 02 Enabled with accel.
b131	Decel. overvolt. suppress level	DC bus voltage of suppression. Range is: 200 V class 330 to 395 400 V class 660 to 790
b132	Decel. overvolt. suppress const.	Accel. rate when b130=02. Set range: 0.10 ~ 30.00 sec.
b133	Decel. overvolt. suppress proportional gain	Proportional gain when b130=01. Range is: 0.00 to 5.00
b134	Decel. overvolt. suppress integral time	Integration time when b130=01. Range is: 0.00 to 150.0
3.23 Controlled stop at power loss

This function is intended to achieve a controlled stop and avoid free-running of the motor when power is lost during run mode. Inverter controls the internal DC bus voltage while decelerating the motor using the regenerative energy to keep the DC bus at a level that allows to reduce the motor speed and avoid a long coasting time. Next diagram shows how the function works:
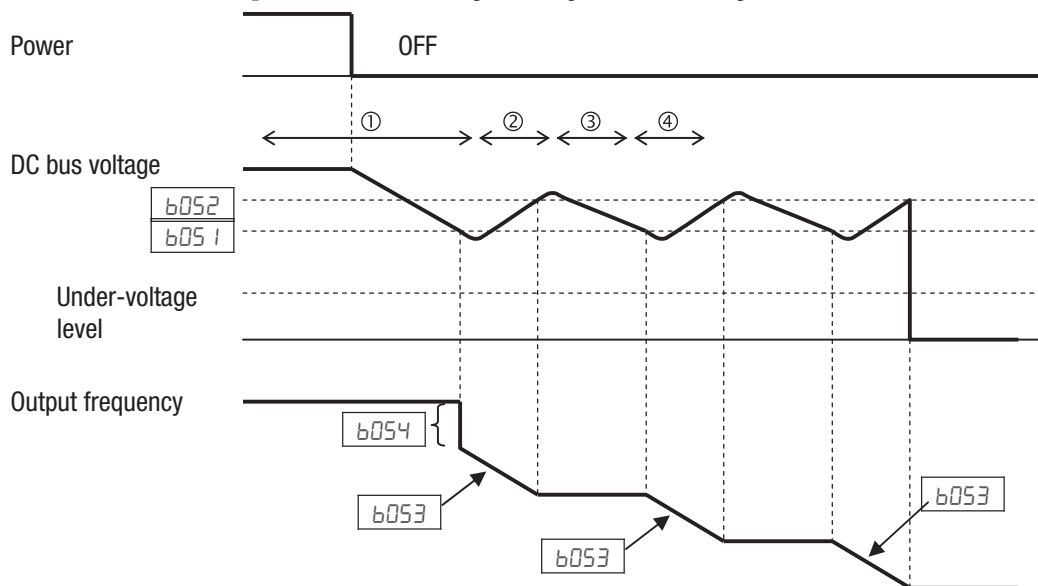

When the DC voltage of the inverter goes down to b051 level, inverter decrease the output frequency by a amount set in b054 to force the motor to regenerate energy that is used to increase the DC bus value. After this the deceleration continue at the rate set in b053 until the upper limit b052 is reach were the deceleration ramp stops until the DC bus drops again. This operation is repated until the motor is totally stopped or there is not enough regeneration from the motor and the DC bus goes below the under-voltage level.

Parameter	Parameter name	Description
b050	Controlled deceleration on power loss	00 Trips 01 Decelerates to a stop 02 Decelerates to a stop with DC bus voltage controlled 03 Decelerates to a stop with DC bus voltage controlled, then restart
b051	DC bus voltage trigger level of ctrl. decel.	Setting of DC bus voltage to start controlled decel. operation. Range is 0.0 to 1000.0
b052	Over-voltage threshold of ctrl. decel.	Setting the OV-LAD stop level of controlled decel. operation. Range is 0.0 to 1000.0
b053	Deceleration time of ctrl. decel.	Range is 0.01 to 3600.0
b054	Initial freq. drop of ctrl. decel.	Setting of initial freq. drop. Range is 0.0 to 10.0 Hz

4 PARAMETER LIST

The PDU (Process Data Unit) register number are addressed starting at zero. Therefore register numbered "0012h" addressed as "0011h". Register address value (transmited on Modbus line) is 1 less than the Register number of the table

4.1 Parameter group D: Monitors

Function code	Function name	Monitoring and setting items	Units	Modbus Register No.
d001 (32-bits)	Output frequency monitor	0 to 40000(100000)	0.01 [Hz]	1001h
				1002h
d002	Output current monitor	0 to 65530	0.01 [A]	1003h
d003	Rotation direction minitoring	0: Stopping, 1: Forward rotation, 2: Reverse rotation	0.1 [Hz]	1004h
d004 (32-bits)	Process variable (PV), PID feedback monitoring	0 to 1000000	0.1	1005h
				1006h
d005	Intelligent input terminal status	2^0: Terminal 1 to 2^6: Terminal 7	1 bit	1007h
d006	Intelligent output terminal status	2^0: Terminal 11 to 2^1: Terminal 12/ 2^2: Relay Terminal	1 bit	1008h
d007 (high)	Scaled output frequency monitor	0 to 4000000(10000000)	0.01	1009h
d007 (low)				100Ah
d008 (high)	Actual-frequency monitor	-100000 to +100000	0.01 [Hz]	100Bh
d008 (low)				100Ch
d009	Torque command monitor	-200 to +200	1 [%]	100Dh

Function code	Function name	Monitoring and setting items	Units	Modbus Register No.
d010	Torque bias monitor	-200 to +200	1 [%]	100Eh
d012	Torque monitor	-200 to +200	1 [%]	1010h
d013	Output voltage monitor	0 to 6000	0.1 [V]	1011h
d014	Power monitor	0 to 1000	0.1 [kW]	1012h
d015 (32-bits)	Watt-hour monitor	0 to 9999000	0.1	1013h 1014h
d016 (32-bits)	Elapsed RUN time monitor	0 to 999900	1 [h]	1015h 1016h
d017 (32-bits)	Elapsed power-on time monitor	0 to 999900	1 [h]	1017h 1018h
d018	Heat sink temperature monitor	-200 to 1500	0.1 [?]	1019h
d022	Life-check monitor	2^0: Capacitor on main circuit board 2^1: cooling-fan	1 bit	101Dh
d023	Drive programming program counter	0~1024		101Eh
d024	Drive programming program number	0~9999		101Fh
d025(32-bits)	User monitor 1	-2147483647 to 2147483647	1	102Eh 102Fh
d026(32-bits)	User monitor 2	-2147483647 to 2147483647	1	1030h 1031h
d027(32-bits)	User monitor 3	-2147483647 to 2147483647	1	1032h 1033h
d029(32-bits)	Position setting monitor	-268435455 to 268435455	1	1036h 1037h
d030(32-bits)	Position feedback monitor	-268435455 to 268435455	1	1038h 1039h
d60	Inverter mode monitor	0 (IM CT) 2(IM High Freq mode) 1(IM VT)		1057h
d80	Trip counter	0 to 65530	-	0011h
d081	Trip info 1	Trip factor Inverter status	-	0012h to 001Bh
d082	Trip info 2	Output frequency (32-bit)	-	001Ch to 0025h
d083	Trip info 3	Output current Output voltage	-	0026h to 002Fh
d084	Trip info 4	Running time (32-bit) Power-on time (32-bit)	-	0030h to 0039h
d085	Trip info 5		-	003Ah to 0043h
d086	Trip info 6		-	0044h to 004Ch
d090	Warning monitor	Warning code	-	004Eh
d102	DC voltage monitoring (across P and N)	0 to 10000	0.1 [V]	1026h
d103	BRD load factor monitoring	0 to 1000	0.1 [%]	1027h
d104	Electronic thermal overload monitoring	0 to 1000	0.1 [%]	1028h

P176	Option I/F command register to read 7	0000 to FFFF	–	✓	16B2h	0000
P177	Option I/F command register to read 8	0000 to FFFF	–	✓	16B3h	0000
P178	Option I/F command register to read 9	0000 to FFFF	–	✓	16B4h	0000
P179	Option I/F command register to read 10	0000 to FFFF	–	✓	16B5h	0000
P180	Profibus Node address	0 to 125	–	✗	16B6h	0
P181	Profibus Clear Node address	00(clear)/01(not clear)	–	✗	16B7h	00
P182	Profibus Map selection	00(PPO)/01(Comvertional)	–	✗	16B8h	00
P190	CompoNet Node address	0 to 63	–	✗	16C0h	0
P192	DeviceNet MAC ID	0 to 63	–	✗	16C2h	63
P195	ML2 frame length	00 (32 byte) / 01 (17 byte)	-	✗	16C5h	00
P196	ML2 Node address	21 - 3E	-	✗	16C6h	21

4.7 Parameter group F

Function code	Function name	Monitoring and setting items	Units	Run mode edit	Modbus Register No.	Default
F001 (32-bits)	Output frequency	0.00 to 400.00	0.01 [Hz]	✓	0001h / 0002h	6.00
F002 (32-bits)	Acceleration time (1)	0.01 to 3600.00	0.01 [s]	✓	1103h / 1104h	10.00
F003(32-bits)	Deceleration time (1)	0.01 to 3600.00	0.01 [s]	✓	1105h / 1106h	10.00
F004	Keypad Run key routing	00: Forward, 01:Reverse	–	✗	1107h	00

4.8 Parameter group U: User parameters

Any function code can be register on these 32 parameters. When display mode is set be "user parameter" only U001 to U032 plus d001, F001, b037 are displayed.

Function code	Function name	Monitoring and setting items	Units	Run mode edit	Modbus Register No.	Default
U001	Usesr parameter 1	"no", d001 - P183	-	✓	-	no
...	....	....	-	✓	-	no
U032	User parameter 32	"no", d001 - P183	-	✓	-	no
