No patent liability is assumed with respect to the use of the information contained herein. Moreover, because OMRON is constantly striving to improve its high-quality products, the information contained in this manual is subject to change without notice. Every precaution has been taken in the preparation of this manual. Nevertheless, OMRON assumes no responsibility for errors or omissions. Neither is any liability assumed for damages resulting from the use of the information contained in this publication.

## Introduction

Thank you for purchasing an NJ-series CPU Unit.
This manual contains information that is necessary to use the NJ-series CPU Unit. Please read this manual and make sure you understand the functionality and performance of the NJ -series CPU Unit before you attempt to use it in a control system.
Keep this manual in a safe place where it will be available for reference during operation.

## Intended Audience

This manual is intended for the following personnel, who must also have knowledge of electrical systems (an electrical engineer or the equivalent).

- Personnel in charge of introducing FA systems.
- Personnel in charge of designing FA systems.
- Personnel in charge of installing and maintaining FA systems.
- Personnel in charge of managing FA systems and facilities.

For programming, this manual is intended for personnel who understand the programming language specifications in international standard IEC 61131-3 or Japanese standard JIS B3503.

## Applicable Products

This manual covers the following products.

- NJ-series CPU Units
- NJ501-1300
- NJ501-1400
- NJ501-1500

## Relevant Manuals

There are three manuals that provide basic information on the NJ -series CPU Units: the NJ -series CPU Unit Hardware User's Manual, the $N J$-series CPU Unit Software User's Manual (this manual), and the NJ -series Instructions Reference Manual.
Most operations are performed from the Sysmac Studio Automation Software. Refer to the Sysmac Studio Version 1 Operation Manual (Cat. No. W504) for information on the Sysmac Studio.
Other manuals are necessary for specific system configurations and applications.
Read all of the manuals that are relevant to your system configuration and application to make the most of the NJ -series CPU Unit.

## Manual Configuration

| NJ-series CPU Unit Hardware User's Manual (Cat. No. W500)

| Section | Description |
| :--- | :--- |
| Section 1 <br> Introduction | This section provides an introduction to the NJ-series Controllers and their features, <br> and gives the NJ-series Controller specifications. |
| Section 2 <br> System Configuration | This section describes the system configuration used for NJ-series Controllers. |
| Section 3 <br> Configuration Units | This section describes the parts and functions of the configuration devices in the NJ- <br> series Controller configuration, including the CPU Unit and Configuration Units. |
| Section 4 <br> Installation and Wiring | This section describes where and how to install the CPU Unit and Configuration Units <br> and how to wire them. |
| Section 5 <br> Troubleshooting | This section describes the event codes, error confirmation methods, and corrections <br> for errors that can occur. |
| Section 6 <br> Inspection and Maintenance | This section describes the contents of periodic inspections, the service life of the Bat- <br> tery and Power Supply Units, and replacement methods for the Battery and Power <br> Supply Units. |
| Appendices | The appendices provide the specifications of the Basic I/O Units, Unit dimensions, <br> load short-circuit protection detection, line disconnection detection, and measures for <br> EMC Directives. |

## NJ-series CPU Unit Software User's Manual (Cat. No. W501)

| Section | Description |
| :--- | :--- |
| Section 1 <br> Introduction | This section provides an introduction to the NJ-series Controllers and their features, <br> and gives the NJ-series Controller specifications. |
| Section 2 <br> CPU Unit Operation | This section describes the variables and control systems of the CPU Unit and CPU <br> Unit status. |
| Section 3 <br> I/O Ports, Slave Configuration, and <br> Unit Configuration | This section describes how to use I/O ports, how to create the slave configuration <br> and unit configuration and how to assign functions. |
| Section 4 <br> Controller Setup | This section describes the initial settings of the function modules. |
| Section 5 <br> Designing Tasks | This section describes the task system and types of tasks. |
| Section 6 <br> Programming | This section describes programming, including the programming languages and the <br> variables and instructions that are used in programming. |
| Section 7 <br> Simulation, Transferring Projects to <br> the Physical CPU Unit, and Opera- <br> tion | This section describes simulation of Controller operation and how to use the results <br> of simulation. |
| Section 8 <br> CPU Unit Status | This section describes CPU Unit status. |
| Section 9 <br> CPU Unit Functions | This section describes the functionality provided by the CPU Unit. |
| Section 10 <br> Communications Setup | This section describes how to go online with the CPU Unit and how to connect to <br> other devices. |
| Section 11 <br> Example of Actual Application Pro- <br> cedures | This section describes the procedures that are used to actually operate an NJ-series <br> Controller. |
| Section 12 <br> Troubleshooting | This section describes the event codes, error confirmation methods, and corrections <br> for errors that can occur. |
| Appendices | The appendices provide the CPU Unit specifications, task execution times, system- <br> defined variable lists, data attribute lists, CJ-series Unit memory information, CJ- <br> series Unit memory allocation methods, and data type conversion information. |

## NJ-series Instructions Reference Manual (Cat. No. W502) (This Manual)

| Section | Description |
| :--- | :--- |
| Section 1 <br> Instruction Set | This section provides a table of the instructions that are described in this manual. |
| Section 2 <br> Instruction Descriptions | This section describes instruction specifications in detail. |
| Appendices | The appendices provide a table of error codes and other supplemental information to <br> use instructions. |

## Read and Understand this Manual

Please read and understand this manual before using the product. Please consult your OMRON representative if you have any questions or comments.

## Warranty and Limitations of Liability

## WARRANTY

OMRON's exclusive warranty is that the products are free from defects in materials and workmanship for a period of one year (or other period if specified) from date of sale by OMRON.

OMRON MAKES NO WARRANTY OR REPRESENTATION, EXPRESS OR IMPLIED, REGARDING NONINFRINGEMENT, MERCHANTABILITY, OR FITNESS FOR PARTICULAR PURPOSE OF THE PRODUCTS. ANY BUYER OR USER ACKNOWLEDGES THAT THE BUYER OR USER ALONE HAS DETERMINED THAT THE PRODUCTS WILL SUITABLY MEET THE REQUIREMENTS OF THEIR INTENDED USE. OMRON DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED.

## LIMITATIONS OF LIABILITY

OMRON SHALL NOT BE RESPONSIBLE FOR SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES, LOSS OF PROFITS OR COMMERCIAL LOSS IN ANY WAY CONNECTED WITH THE PRODUCTS, WHETHER SUCH CLAIM IS BASED ON CONTRACT, WARRANTY, NEGLIGENCE, OR STRICT LIABILITY.

In no event shall the responsibility of OMRON for any act exceed the individual price of the product on which liability is asserted.

IN NO EVENT SHALL OMRON BE RESPONSIBLE FOR WARRANTY, REPAIR, OR OTHER CLAIMS REGARDING THE PRODUCTS UNLESS OMRON'S ANALYSIS CONFIRMS THAT THE PRODUCTS WERE PROPERLY HANDLED, STORED, INSTALLED, AND MAINTAINED AND NOT SUBJECT TO CONTAMINATION, ABUSE, MISUSE, OR INAPPROPRIATE MODIFICATION OR REPAIR.

## Application Considerations

## SUITABILITY FOR USE

OMRON shall not be responsible for conformity with any standards, codes, or regulations that apply to the combination of products in the customer's application or use of the products.

At the customer's request, OMRON will provide applicable third party certification documents identifying ratings and limitations of use that apply to the products. This information by itself is not sufficient for a complete determination of the suitability of the products in combination with the end product, machine, system, or other application or use.

The following are some examples of applications for which particular attention must be given. This is not intended to be an exhaustive list of all possible uses of the products, nor is it intended to imply that the uses listed may be suitable for the products:

- Outdoor use, uses involving potential chemical contamination or electrical interference, or conditions or uses not described in this manual.
- Nuclear energy control systems, combustion systems, railroad systems, aviation systems, medical equipment, amusement machines, vehicles, safety equipment, and installations subject to separate industry or government regulations.
- Systems, machines, and equipment that could present a risk to life or property.

Please know and observe all prohibitions of use applicable to the products.
NEVER USE THE PRODUCTS FOR AN APPLICATION INVOLVING SERIOUS RISK TO LIFE OR PROPERTY WITHOUT ENSURING THAT THE SYSTEM AS A WHOLE HAS BEEN DESIGNED TO ADDRESS THE RISKS, AND THAT THE OMRON PRODUCTS ARE PROPERLY RATED AND INSTALLED FOR THE INTENDED USE WITHIN THE OVERALL EQUIPMENT OR SYSTEM.

## PROGRAMMABLE PRODUCTS

OMRON shall not be responsible for the user's programming of a programmable product, or any consequence thereof.

## Disclaimers

## CHANGE IN SPECIFICATIONS

Product specifications and accessories may be changed at any time based on improvements and other reasons.

It is our practice to change model numbers when published ratings or features are changed, or when significant construction changes are made. However, some specifications of the products may be changed without any notice. When in doubt, special model numbers may be assigned to fix or establish key specifications for your application on your request. Please consult with your OMRON representative at any time to confirm actual specifications of purchased products.

## DIMENSIONS AND WEIGHTS

Dimensions and weights are nominal and are not to be used for manufacturing purposes, even when tolerances are shown.

## PERFORMANCE DATA

Performance data given in this manual is provided as a guide for the user in determining suitability and does not constitute a warranty. It may represent the result of OMRON's test conditions, and the users must correlate it to actual application requirements. Actual performance is subject to the OMRON Warranty and Limitations of Liability.

## ERRORS AND OMISSIONS

The information in this manual has been carefully checked and is believed to be accurate; however, no responsibility is assumed for clerical, typographical, or proofreading errors, or omissions.

## Safety Precautions

Refer to the following manuals for safety precautions.

- NJ-series CPU Unit Hardware User's Manual (Cat No. W500)
- NJ-series CPU Unit Software User's Manual (Cat No. W501)

## Precautions for Safe Use

Refer to the following manuals for precautions for safe use.

- NJ-series CPU Unit Hardware User's Manual (Cat No. W500)
- NJ-series CPU Unit Software User's Manual (Cat No. W501)

## Precautions for Correct Use

Refer to the following manuals for precautions for correct use.

- NJ-series CPU Unit Hardware User's Manual (Cat No. W500)
- NJ-series CPU Unit Software User's Manual (Cat No. W501)

## Regulations and Standards

## Conformance to EC Directives

## Applicable Directives

- EMC Directives
- Low Voltage Directive

## Concepts

## - EMC Directive

OMRON devices that comply with EC Directives also conform to the related EMC standards so that they can be more easily built into other devices or the overall machine. The actual products have been checked for conformity to EMC standards.*
Whether the products conform to the standards in the system used by the customer, however, must be checked by the customer. EMC-related performance of the OMRON devices that comply with EC Directives will vary depending on the configuration, wiring, and other conditions of the equipment or control panel on which the OMRON devices are installed. The customer must, therefore, perform the final check to confirm that devices and the overall machine conform to EMC standards.

* Applicable EMC (Electromagnetic Compatibility) standards are as follows:

EMS (Electromagnetic Susceptibility): EN 61131-2 and EN 61000-6-2
EMI (Electromagnetic Interference): EN 61131-2 and EN 61000-6-4 (Radiated emission: 10-m regulations)

## - Low Voltage Directive

Always ensure that devices operating at voltages of 50 to 1,000 VAC and 75 to 1,500 VDC meet the required safety standards. The applicable directive is EN 61131-2.

## - Conformance to EC Directives

The NJ-series Controllers comply with EC Directives. To ensure that the machine or device in which the NJ-series Controller is used complies with EC Directives, the Controller must be installed as follows:

- The NJ-series Controller must be installed within a control panel.
- You must use reinforced insulation or double insulation for the DC power supplies connected to DC Power Supply Units and I/O Units.
- NJ-series Controllers that comply with EC Directives also conform to the Common Emission Standard (EN 61000-6-4). Radiated emission characteristics (10-m regulations) may vary depending on the configuration of the control panel used, other devices connected to the control panel, wiring, and other conditions.
You must therefore confirm that the overall machine or equipment complies with EC Directives.

## Conformance to Shipbuilding Standards

The NJ-series Controllers comply with the following shipbuilding standards. Applicability to the shipbuilding standards is based on certain usage conditions. It may not be possible to use the product in some locations. Contact your OMRON representative before attempting to use a Controller on a ship.

## Usage Conditions for NK and LR Shipbuilding Standards

- The NJ-series Controller must be installed within a control panel.
- Gaps in the door to the control panel must be completely filled or covered with gaskets or other material.
- The following noise filter must be connected to the power supply line.

## Noise Filter

| Manufacturer | Model |
| :--- | :---: |
| Cosel Co., Ltd. | TAH-06-683 |

## Trademarks

- Sysmac and SYSMAC are trademarks or registered trademarks of OMRON Corporation in Japan and other countries for OMRON factory automation products.
- Windows, Windows 98, Windows XP, Windows Vista, and Windows 7 are registered trademarks of Microsoft Corporation in the USA and other countries.
- EtherCAT ${ }^{\circledR}$ is a registered trademark of Beckhoff Automation GmbH for their patented technology.
- The SD logo is a trademark of SD-3C, LLC.

Other company names and product names in this document are the trademarks or registered trademarks of their respective companies.

## Software Licenses and Copyrights

This product incorporates certain third party software. The license and copyright information associated with this software is available at http://www.fa.omron.co.jp/nj_info_e/.

## Unit Versions

## Unit Versions

A "unit version" has been introduced to manage CPU Units in the NJ Series according to differences in functionality accompanying Unit upgrades.

## Notation of Unit Versions on Products

The unit version is given on the ID information label of the products for which unit versions are managed, as shown below.
Example for NJ -series $\mathrm{NJ} 501-\square \square \square \square$ CPU Unit:

The following information is provided on the ID information label.

| Item | Description |
| :--- | :--- |
| Unit model | Gives the model of the Unit. |
| Unit version | Gives the unit version of the Unit. |
| Lot number and <br> serial number | Gives the lot number and serial number of the Unit. <br> DDMYY: Lot number, $\square:$ For use by OMRON, xxxx: Serial number <br> "M" gives the month (1 to 9: January to September, X: October, Y: November, Z: December) |
| MAC address | Gives the MAC address of the built-in port on the Unit. |

## Confirming Unit Versions with Sysmac Studio

You can use the Unit Production Information on the Sysmac Studio to check the unit version of the CPU Unit, CJ-series Special I/O Units, CJ-series CPU Bus Units, and EtherCAT slaves. The unit versions of CJ-series Basic I/O Units cannot be checked from the Sysmac Studio.

## - CPU Unit and CJ-series Units

1
Double-click CPU/Expansion Racks under Configurations and Setup in the Multiview Explorer. Or, right-click CPU/Expansion Racks under Configurations and Setup and select Edit from the menu.
The Unit Editor is displayed for the Controller Configurations and Setup layer.

2 Right-click any open space in the Unit Editor and select Production Information. The Production Information Dialog Box is displayed.

Simple Display

Detailed Display

In this example, "Ver.1.0" is displayed next to the unit model.
The following items are displayed.

| CPU Unit | CJ-series Units |
| :--- | :--- |
| Unit model | Unit model |
| Unit version | Unit version |
| Lot number | Lot number |
|  | Rack number, slot number, and unit number |

## - EtherCAT Slaves

1 Double-click EtherCAT under Configurations and Setup in the Multiview Explorer. Or, rightclick EtherCAT under Configurations and Setup and select Edit from the menu.

The EtherCAT Configuration Tab Page is displayed for the Controller Configurations and Setup layer.

2 Right-click the master in the EtherCAT Configurations Editing Pane and select Display Production Information.
The Production Information Dialog Box is displayed.

The following items are displayed.
Node address
Type information*
Serial number

* If the model number cannot be determined (such as when there is no ESI file), the vendor ID, product code, and revision number are displayed.

## Unit Version Notation

In this manual, unit versions are specified as shown in the following table.

| Product nameplate | Notation in this manual | Remarks |
| :--- | :--- | :--- |
| "Ver.1.0" or later to the right of <br> the lot number | Unit version 1.0 or later | Unless unit versions are specified, the information in this manual <br> applies to all unit versions. |

## Related Manuals

The following manuals are related to the NJ -series Controllers. Use these manuals for reference.

| Manual name | Cat. No. | Model numbers | Application | Description |
| :---: | :---: | :---: | :---: | :---: |
| NJ -series CPU Unit Hardware User's Manual | W500 |  | Learning the basic specifications of the NJ -series CPU Units, including introductory information, designing, installation, and maintenance. Mainly hardware information is provided. | An introduction to the entire NJ -series system is provided along with the following information on a Controller built with an NJ501 CPU Unit. <br> - Features and system configuration <br> - Introduction <br> - Part names and functions <br> - General specifications <br> - Installation and wiring <br> - Maintenance and inspection <br> Use this manual together with the $N J$-series CPU Unit Software User's Manual (Cat. No. W501). |
| NJ -series CPU Unit Software User's Manual | W501 | NJ501-प] | Learning how to program and set up an NJ -series CPU Unit. Mainly software information is provided. | The following information is provided on a Controller built with an NJ501 CPU Unit. <br> - CPU Unit operation <br> - CPU Unit features <br> - Initial settings <br> - Programming based on IEC 61131-3 language specifications <br> Use this manual together with the NJ -series CPU Unit Hardware User's Manual (Cat. No. W500). |
| NJ-series CPU Unit Motion Control User's Manual | W507 | NJ501-प] | Learning about motion control settings and programming concepts. | The settings and operation of the CPU Unit and programming concepts for motion control are described. Use this manual together with the NJ-series CPU Unit Hardware User's Manual (Cat. No. W500) and NJ -series CPU Unit Software User's Manual (Cat. No. W501). |
| NJ-series Instructions Reference Manual | W502 | NJ501-\] | Learning about the specifications of the instruction set that is provided by OMRON. | The instructions in the instruction set (IEC 61131-3 specifications) are described. When programming, use this manual together with the NJ-series CPU Unit Hardware User's Manual (Cat. No. W500) and NJ-series CPU Unit Software User's Manual (Cat. No. W501). |
| NJ -series Motion Control Instructions Reference Manual | W508 | NJ501-प] | Learning about the specifications of the motion control instructions that are provided by OMRON. | The motion control instructions are described. When programming, use this manual together with the NJ-series CPU Unit Hardware User's Manual (Cat. No. W500), NJ-series CPU Unit Software User's Manual (Cat. No. W501) and NJ-series CPU Unit Motion Control User's Manual (Cat. No. W507). |
| CJ-series Special Unit Manuals for NJ -series CPU Unit | W490 <br> W498 <br> W499 <br> W491 <br> Z310 <br> W492 <br> W494 <br> W497 |  | Learning how to use CJ series Units with an NJseries CPU Unit. | The methods and precautions for using CJseries Units with an NJ501 CPU Unit are described, including access methods and programming interfaces. Manuals are available for the following Units. <br> Analog I/O Units, Insulated-type Analog I/O Units, Temperature Control Units, ID Sensor Units, High-speed Counter Units, Serial Communications Units, and DeviceNet Units. <br> Use these manuals together with the NJ -series CPU Unit Hardware User's Manual (Cat. No. W500) and NJ -series CPU Unit Software User's Manual (Cat. No. W501). |

| Manual name | Cat. No. | Model numbers | Application | Description |
| :---: | :---: | :---: | :---: | :---: |
| NJ-series CPU Unit Builtin EtherCAT Port User's Manual | W505 | NJ501- $\square \square \square \square$ | Using the built-in EtherCAT port on an NJ -series CPU Unit. | Information on the built-in EtherCAT port is provided. This manual provides an introduction and provides information on the configuration, features, and setup. <br> Use this manual together with the NJ -series CPU Unit Hardware User's Manual (Cat. No. W500) and NJ -series CPU Unit Software User's Manual (Cat. No. W501). |
| NJ-series CPU Unit Builtin EtherNet/IP Port User's Manual | W506 | NJ501- $\square \square \square \square$ | Using the built-in EtherNet/IP port on an NJ-series CPU Unit. | Information on the built-in EtherNet/IP port is provided. Information is provided on the basic setup, tag data links, and other features. Use this manual together with the NJ -series CPU Unit Hardware User's Manual (Cat. No. W500) and NJ -series CPU Unit Software User's Manual (Cat. No. W501). |
| NJ-series Troubleshooting Manual | W503 | NJ501- $\square \square \square \square$ | Learning about the errors that may be detected in an NJ-series Controller. | Concepts on managing errors that may be detected in an NJ-series Controller and information on individual errors are described. <br> Use this manual together with the NJ -series CPU Unit Hardware User's Manual (Cat. No. W500) and NJ -series CPU Unit Software User's Manual (Cat. No. W501). |
| Sysmac Studio Version 1 Operation Manual | W504 | SYSMACSE2 | Learning about the operating procedures and functions of the Sysmac Studio. | Describes the operating procedures of the Sysmac Studio. |
| CX-Integrator CS/CJ/CP/NSJ-series Network Configuration Tool Operation Manual | W464 |  | Learning how to configure networks (data links, routing tables, Communications Unit settings, etc.). | Describes operating procedures for the CX-Integrator. |
| CX-Designer User's Manual | V099 |  | Learning to create screen data for NS-series Programmable Terminals. | Describes operating procedures for the CXDesigner. |
| CX-Protocol Operation Manual | W344 |  | Creating data transfer protocols for general-purpose devices connected to CJseries Serial Communications Units. | Describes operating procedures for the CX-Protocol. |

## Revision History

A manual revision code appears as a suffix to the catalog number on the front and back covers of the manual.

# Cat. No. W502-E1-01 

| Revision code | Date | Revised content |
| :---: | :---: | :--- |
| 01 | July 2011 | Original production |

## Instruction Set

This section provides a table of the instructions that you can use with NJ -series Controllers.
Instruction Set1-2

## Instruction Set

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Ladder Diagram Instructions | LD | Load | Reads the value of a BOOL variable. | 2-14 |
|  | LDN | Load NOT | Reads the inverse of the value of a BOOL variable. | 2-14 |
|  | AND | AND | Takes the logical AND of the value of a BOOL variable and the input value. | 2-16 |
|  | ANDN | AND NOT | Takes the logical AND of the inverse of the value of a BOOL variable and the input value. | 2-16 |
|  | OR | OR | Takes the logical OR of the value of a BOOL variable and the execution condition. | 2-18 |
|  | ORN | OR NOT | Takes the logical OR of the inverse of the value of a BOOL variable and the execution condition. | 2-18 |
|  | Out | Output | Takes the logical result from the previous instruction and outputs it to a BOOL variable. | 2-20 |
|  | OutNot | Output NOT | Takes the inverse of the logical result from the previous instruction and outputs it to a BOOL variable. | 2-20 |
| ST Statement Instructions | IF | If | Uses the evaluation result of a specified condition expression to select one of two statements to execute. | 2-24 |
|  | CASE | Case | Selects the statement to execute based on the value of a specified integer expression. | 2-28 |
|  | WHILE | While | Repeatedly executes a statement as long as the evaluation result of a specified condition expression is TRUE. | 2-32 |
|  | REPEAT | Repeat | Executes a statement once and then executes it repeatedly until a specified condition expression is TRUE. | 2-34 |
|  | RETURN | Return | Ends a function or function block and returns processing to the calling instruction. | 2-36 |
|  | FOR | Repeat Start | Marks the starting position for repeat processing of statements between the FOR and END_FOR statements and specifies the repeat condition. | 2-37 |
|  | EXIT | Break Loop | Cancels repeat processing from the lowest level FOR statement to the END_FOR statement. | 2-38 |
| Sequence Input Instructions | R_TRIG (Up) | Up Trigger | Outputs TRUE for one task period only when the input signal changes to TRUE. | 2-40 |
|  | F_TRIG (Down) | Down Trigger | Outputs TRUE for one task period only when the input signal changes to FALSE. | 2-40 |
|  | TestABit | Test A Bit | Outputs the value of the specified bit in a bit string. | 2-43 |
|  | TestABitN | Test A Bit NOT | Outputs the inverse of the value of the specified bit in a bit string. | 2-43 |
| Sequence Output Instructions | RS | Reset-Priority Keep | Retains the value of a BOOL variable. It gives priority to the Reset input if both the Set input and Reset input are TRUE. | 2-46 |

| Type | Instruction | Name | Function | Page |
| :--- | :--- | :--- | :--- | :--- |
| Sequence Out- <br> put Instructions | SR | Set-Priority Keep |  |  | | Retains the value of a BOOL variable. It gives |
| :--- |
| priority to the Set input if both the Set input and |
| Reset input are TRUE. | 2-48

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Comparison Instructions | GTascii | Text String Comparison Greater Than | Performs a greater than comparison between text strings. | 2-95 |
|  | GEascii | Text String Comparison Greater Than or Equal | Performs a greater than or equal comparison between text strings. | 2-95 |
|  | Cmp | Compare | Compares two values. | 2-98 |
|  | ZoneCmp | Zone Comparison | Determines if the comparison data is within the specified maximum and minimum values. | 2-100 |
|  | TableCmp | Table Comparison | Compares the comparison data with multiple defined ranges in a comparison table. | 2-102 |
|  | AryCmpEQ | Array Comparison Equal | Determines if the corresponding elements of two arrays are equal. | 2-105 |
|  | AryCmpNE | Array Comparison Not Equal | Determines if the corresponding elements of two arrays are not equal. | 2-105 |
|  | AryCmpLT | Array Comparison Less Than | Performs a less than comparison between the corresponding elements of two arrays. | 2-107 |
|  | AryCmpLE | Array Comparison Less Than Or Equal | Performs a less than or equal comparison between the corresponding elements of two arrays. | 2-107 |
|  | AryCmpGT | Array Comparison Greater Than | Performs a greater than comparison between the corresponding elements of two arrays. | 2-107 |
|  | AryCmpGE | Array Comparison Greater Than Or Equal | Performs a greater than or equal comparison between the corresponding elements of two arrays. | 2-107 |
|  | AryCmpEQV | Array Value Comparison Equal | Determines if the elements of an array are equal to a value. | 2-110 |
|  | AryCmpNEV | Array Value Comparison Not Equal | Determines if the elements of an array are not equal to a value. | 2-110 |
|  | AryCmpLTV | Array Value Comparison Less Than | Performs a less than comparison between a value and the elements of an array. | 2-112 |
|  | AryCmpLEV | Array Value Comparison Less Than Or Equal | Performs a less than or equal comparison between a value and the elements of an array. | 2-112 |
|  | AryCmpGTV | Array Value Comparison Greater Than | Performs a greater than comparison between a value and the elements of an array. | 2-112 |
|  | AryCmpGEV | Array Value Comparison Greater Than Or Equal | Performs a greater than or equal comparison between a value and the elements of an array. | 2-112 |
| Timer Instructions | TON | On-Delay Timer | Outputs TRUE when the set time elapses after the timer starts. | 2-116 |
|  | TOF | Off-Delay Timer | Outputs FALSE when the set time elapses after the timer starts. | 2-120 |
|  | TP | Timer Pulse | Outputs TRUE while the set time elapses after the timer starts. | 2-123 |
|  | AccumulationTimer | Accumulation Timer | Totals the time that the timer input is TRUE. | 2-126 |
|  | Timer | Hundred-ms Timer | Outputs TRUE when the set time elapses after the timer starts. Set the time in increments of 100 ms . The timing accuracy is 100 ms . | 2-129 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Counter Instructions | CTD | Down-counter | Decrements the counter value when the counter input signal is received. The preset value and counter value must have an INT data type. | 2-134 |
|  | CTD_** | Down-counter Group | Decrements the counter value when the counter input signal is received. The preset value and counter value must be one of the following data types: DINT, LINT, UDINT, or ULINT. | 2-136 |
|  | CTU | Up-counter | Increments the counter value when the counter input signal is received. The preset value and counter value must have an INT data type. | 2-138 |
|  | CTU_** | Up-counter Group | Increments the counter value when the counter input signal is received. The preset value and counter value must be one of the following data types: DINT, LINT, UDINT, or ULINT. | 2-140 |
|  | CTUD | Up-down Counter | Creates an up-down counter that operates according to an up-counter input and a downcounter input. The preset value and counter value must have an INT data type. | 2-142 |
|  | CTUD_** | Up-down Counter Group | Creates an up-down counter that operates according to an up-counter input and a downcounter input. The preset value and counter value must be one of the following data types: DINT, LINT, UDINT, or ULINT. | 2-146 |
| Math Instructions | ADD (+) | Addition | Adds integers and real numbers. Also joins text strings. | 2-152 |
|  | AddOU (+OU) | Addition with Overflow/ Underflow Check | Adds integers and real numbers. Also performs an overflow/underflow check. | 2-154 |
|  | SUB (-) | Subtraction | Subtracts integers and real numbers. | 2-156 |
|  | SubOU (-OU) | Subtraction with Overflow/ Underflow Check | Subtracts integers or real numbers. Also performs an overflow/underflow check. | 2-158 |
|  | MUL (*) | Multiplication | Multiplies integers and real numbers. | 2-161 |
|  | MuIOU (*OU) | Multiplication with Overflow/ <br> Underflow Check | Multiplies integers and real numbers and outputs the result. It also performs an overflow/underflow check. | 2-163 |
|  | DIV (/) | Division | Divides integers or real numbers. | 2-166 |
|  | MOD | Modulo-division | Finds the remainder for division of integers. | 2-168 |
|  | ABS | Absolute Value | Finds the absolute value of an integer or real number. | 2-170 |
|  | RadToDeg | Radians to Degrees | Converts a real number from radians (rad) to degrees ( ${ }^{\circ}$ ). | 2-172 |
|  | DegToRad | Degrees to Radians | Converts a real number from degrees $\left({ }^{\circ}\right)$ to radians (rad). | 2-172 |
|  | SIN | Sine in Radians | Calculates the sine of a real number. | 2-174 |
|  | COS | Cosine in Radians | Calculates the cosine of a real number. | 2-174 |
|  | TAN | Tangent in Radians | Calculates the tangent of a real number. | 2-174 |
|  | ASIN | Principal Arc Sine | Calculates the arcsine of a real number. | 2-177 |
|  | ACOS | Principal Arc Cosine | Calculates the arccosine of a real number. | 2-177 |
|  | ATAN | Principal Arc Tangent | Calculates the arctangent of a real number. | 2-177 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Math Instructions | SQRT | Square Root | Finds the square root of a number. | 2-180 |
|  | LN | Natural Logarithm | Finds the natural logarithm of a real number. | 2-182 |
|  | LOG | Logarithm Base 10 | Finds the base-10 logarithm of a real number. | 2-182 |
|  | EXP | Natural Exponential Operation | Performs calculations for the natural exponential function. | 2-185 |
|  | EXPT (**) | Exponentiation | Raises one real number to the power of another real number. | 2-187 |
|  | Inc | Increment | Increments an integer value. | 2-189 |
|  | Dec | Decrement | Decrements an integer value. | 2-189 |
|  | Rand | Random Number | Generates pseudorandom numbers. | 2-191 |
|  | AryAdd | Array Addition | Adds corresponding elements of two arrays. | 2-193 |
|  | AryAddV | Array Value Addition | Adds the same value to specified elements of an array. | 2-195 |
|  | ArySub | Array Subtraction | Subtracts corresponding elements of two arrays. | 2-197 |
|  | ArySubV | Array Value Subtraction | Subtracts the same value from specified elements of an array. | 2-199 |
|  | AryMean | Array Mean | Calculates the average of the elements of an array. | 2-201 |
|  | ArySD | Array Element Standard Deviation | Calculates standard deviation of the elements of an array. | 2-203 |
|  | ModReal | Real Number Modulo-division | Calculates the remainder of real number division. | 2-205 |
|  | Fraction | Real Number Fraction | Finds the fractional part of a real number. | 2-207 |
|  | CheckReal | Real Number Check | Checks a real number to see if it is infinity or nonnumeric data. | 2-209 |
| BCD Conversion Instructions | **_BCD_TO_*** | BCD-to-Unsigned Integer Conversion Group | Converts BCD bit strings into unsigned integers. | 2-212 |
|  | **_TO_BCD_*** | Unsigned Integer-to-BCD Conversion Group | Converts unsigned integers to BCD bit strings. | 2-215 |
|  | BCD_TO_** | BCD Data Type-toUnsigned Integer Conversion Group | Converts BCD bit strings into unsigned integers. | 2-218 |
|  | BCDsToBin | Signed BCD-toSigned Integer Conversion | Converts signed BCD bit strings to signed integers. | 2-221 |
|  | BinToBCDs_** | Signed Integer-toBCD Conversion Group | Converts signed integers to signed $B C D$ bit strings. | 2-224 |
|  | AryToBCD | Array BCD Conversion | Converts the elements of an unsigned integer array to BCD bit strings. | 2-227 |
|  | AryToBin | Array Unsigned Integer Conversion | Converts the elements of an array of BCD bit strings into unsigned integers. | 2-229 |
| Data Type Conversion Instructions | $\begin{aligned} & \text { **_TO_*** (Integer-to- } \\ & \text { Integer Conversion } \\ & \text { Group) } \end{aligned}$ | Integer-to-Integer Conversion Group | Converts integers to integers with different data types. | 2-232 |
|  | **_TO_*** (Integer-toBit String Conversion Group) | Integer-to-Bit String Conversion Group | Converts integers to bit strings. | 2-235 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Data Type Conversion Instructions | **_TO_*** (Integer-toReal Number Conversion Group) | Integer-to-Real <br> Number <br> Conversion Group | Converts integers to real numbers. | 2-237 |
|  | **_TO_*** (Bit String-toInteger Conversion Group) | Bit String-toInteger Conversion Group | Converts bit strings to integers. | 2-239 |
|  | **_TO_*** (Bit String-toBit String Conversion Group) | Bit String-to-Bit String Conversion Group | Converts bit strings to bit strings with different data types. | 2-242 |
|  | **_TO_*** (Bit String-toReal Number Conversion Group) | Bit String-to-Real Number Conversion Group | Converts bit strings to real numbers. | 2-244 |
|  | **_TO_*** (Real Num-ber-to-Integer Conversion Group) | Real Number-toInteger Conversion Group | Converts real numbers to integers. | 2-246 |
|  | **_TO_*** (Real Num-ber-to-Bit String Conversion Group) | Real Number-to-Bit String Conversion Group | Converts real numbers to bit strings. | 2-249 |
|  | **_TO_*** (Real Num-ber-to-Real Number Conversion Group) | Real Number-toReal Number Conversion Group | Converts real numbers to real numbers with different data types. | 2-251 |
|  | **_TO_STRING (Inte-ger-to-Text String Conversion Group) | Integer-to-Text String Conversion Group | Converts integers to text strings. | 2-253 |
|  | **_TO_STRING (Bit String-to-Text String Conversion Group) | Bit String-to-Text String Conversion Group | Converts bit strings to text strings. | 2-255 |
|  | **_TO_STRING (Real Number-to-Text String Conversion Group) | Real Number-toText String Conversion Group | Converts real numbers to text strings. | 2-257 |
|  | RealToFormatString | REAL-to- <br> Formatted Text String | Converts a REAL variable to a text string with the specified format. | 2-259 |
|  | LrealToFormatString | LREAL-toFormatted Text String | Converts a LREAL variable to a text string with the specified format. | 2-264 |
|  | STRING_TO_** (Text String-to-Integer Conversion Group) | Text String-toInteger Conversion Group | Converts text strings to integers. | 2-270 |
|  | STRING_TO_** (Text String-to-Bit String Conversion Group) | Text String-to-Bit String Conversion Group | Converts text strings to bit strings. | 2-272 |
|  | STRING_TO_** (Text String-to-Real Number Conversion Group) | Text String-to-Real Number Conversion Group | Converts text strings to real numbers. | 2-274 |
|  | TO_** (Integer Conversion Group) | Integer Conversion Group | Converts integers, bit strings, real numbers, and text strings to integers. | 2-277 |
|  | TO_** (Bit String Conversion Group) | Bit String Conversion Group | Converts integers, bit strings, real numbers, and text strings to bit strings. | 2-279 |
|  | TO_** (Real Number Conversion Group) | Real Number Conversion Group | Converts integers, bit strings, real numbers, and text strings to real numbers. | 2-281 |
|  | TRUNC | Truncate | Truncates a real number at the first decimal digit to make an integer. | 2-283 |
|  | Round | Round Off Real Number | Rounds a real number at the first decimal digit to make an integer. | 2-283 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Data Type Conversion Instructions | RoundUp | Round Up Real Number | Rounds up a real number at the first decimal digit to make an integer. | 2-283 |
| Bit String Processing Instructions | AND (\&) | Logical AND | Performs a logical AND operation on Boolean variables or individual bits in bit stings. | 2-286 |
|  | OR | Logical OR | Performs a logical OR operation on Boolean variables or individual bits in bit stings. | 2-286 |
|  | XOR | Logical Exclusive OR | Performs a logical exclusive OR operation on Boolean variables or individual bits in bit stings. | 2-286 |
|  | XORN | Logical Exclusive NOR | Performs a logical exclusive NOR operation on Boolean variables or individual bits in bit stings. | 2-289 |
|  | NOT | Bit Reversal | Reverses the value of a Boolean variable or individual bits in a bit string. | 2-291 |
|  | AryAnd | Array Logical AND | Performs a logical AND operation on Boolean variables or individual bits in bit stings between arrays. | 2-293 |
|  | AryOr | Array Logical OR | Performs a logical OR operation on Boolean variables or individual bits in bit stings between arrays. | 2-293 |
|  | AryXor | Array Logical Exclusive OR | Performs a logical exclusive OR operation on Boolean variables or individual bits in bit stings between arrays. | 2-293 |
|  | AryXorN | Array Logical Exclusive NOR | Performs a logical exclusive NOR operation on Boolean variables or individual bits in bit stings between arrays. | 2-293 |
| Selection Instructions | SEL | Binary Selection | Selects one of two selections. | 2-298 |
|  | MUX | Multiplexer | Selects one of two to five selections. | 2-300 |
|  | LIMIT | Limiter | Limits the value of the input variable to the specified minimum and maximum values. | 2-302 |
|  | Band | Deadband Control | Performs deadband control. | 2-304 |
|  | Zone | Dead Zone Control | Adds a bias value to the input value. | 2-307 |
|  | MAX | Maximum | Finds the largest of two to five values. | 2-310 |
|  | MIN | Minimum | Finds the smallest of two to five values. | 2-310 |
|  | AryMax | Array Maximum | Finds the elements with the largest value in a one-dimensional array. | 2-312 |
|  | AryMin | Array Minimum | Finds the elements with the smallest value in a one-dimensional array. | 2-312 |
|  | ArySearch | Array Search | Searches for the specified value in a onedimensional array. | 2-314 |
| Data Movement Instructions | MOVE | Move | Moves the value of a constant or variable to another variable. | 2-318 |
|  | MoveBit | Move Bit | Moves one bit in a bit string. | 2-321 |
|  | MoveDigit | Move Digit | Moves digits (4 bits per digit) in a bit string. | 2-323 |
|  | TransBits | Move Bits | Moves one or more bits in a bit string. | 2-325 |
|  | MemCopy | Memory Copy | Moves one or more array elements. The move source and move destination must have the same data type. | 2-327 |
|  | SetBlock | Block Set | Moves the value of a variable or constant to one or more array elements. | 2-329 |
|  | Exchange | Data Exchange | Exchanges the values of two variables. | 2-331 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Data Movement Instructions | AryExchange | Array Data Exchange | Exchanges the elements of two arrays. | 2-333 |
|  | AryMove | Array Move | Moves one or more array elements. The data types of the move source and move destination can be different. | 2-335 |
|  | Clear | Initialize | Initializes a variable. | 2-337 |
|  | Copy**ToNum (Bit String to Signed Integer) | Bit Pattern Copy (Bit String to Signed Integer) Group | Copies the content of a bit string directly to a signed integer. | 2-339 |
|  | Copy**To*** (Bit String to Real Number) | Bit Pattern Copy (Bit String to Real Number) Group | Copies the content of a bit string directly to a real number. | 2-341 |
|  | CopyNumTo** (Signed Integer to Bit String) | Bit Pattern Copy (Signed Integer to Bit String) Group | Copies the content of a signed integer directly to a bit string. | 2-343 |
|  | CopyNumTo** (Signed Integer to Real Number) | Bit Pattern Copy (Signed Integer to Real Number) Group | Copies the content of a signed integer directly to a real number. | 2-345 |
|  | Copy**To*** (Real Number to Bit String) | Bit Pattern Copy (Real Number to Bit String) Group | Copies the content of a real number directly to a bit string. | 2-347 |
|  | Copy**ToNum (Real Number to Signed Integer) | Bit Pattern Copy (Real Number to Signed Integer) Group | Copies the content of a real number directly to a signed integer. | 2-349 |
| Shift Instructions | AryShiftReg | Shift Register | Shifts a bit string one bit to the left and inserts the input value to the least-significant bit. The bit string consists of array elements. | 2-352 |
|  | AryShiftRegLR | Reversible Shift Register | Shifts a bit string one bit to the left or right and inserts the input value to the least-significant or most-significant bit. The bit string consists of array elements. | 2-354 |
|  | ArySHL | Array N-element Left Shift | Shifts array elements by one or more elements to the left (toward the higher elements). | 2-357 |
|  | ArySHR | Array N-element Right Shift | Shifts array elements by one or more elements to the right (toward the lower elements). | 2-357 |
|  | SHL | N-bit Left Shift | Shifts a bit string by one or more bits to the left (toward the higher bits). | 2-360 |
|  | SHR | N-bit Right Shift | Shifts a bit string by one or more bits to the right (toward the lower bits). | 2-360 |
|  | NSHLC | Shift N-bits Left with Carry | Shifts an array of bit strings that includes the Carry (CY) Flag by one or more bits to the left (toward the higher elements). | 2-362 |
|  | NSHRC | Shift N-bits Right with Carry | Shifts an array of bit strings that includes the Carry (CY) Flag by one or more bits to the right (toward the lower elements). | 2-362 |
|  | ROL | Rotate N-bits Left | Rotates a bit string by one or more bits to the left (toward the higher bits). | 2-364 |
|  | ROR | Rotate N-bits Right | Rotates a bit string by one or more bits to the right (toward the lower bits). | 2-364 |
| Conversion Instructions | Swap | Swap Bytes | Swaps the upper byte and lower byte of a 16bit value. | 2-368 |
|  | Neg | Reverse Sign | Reverses the sign of a number. | 2-369 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Conversion Instructions | Decoder | Bit Decoder | Sets the specified bit to TRUE and the other bits to FALSE in array elements that consist of a maximum of 256 bits. | 2-371 |
|  | Encoder | Bit Encoder | Finds the position of the highest TRUE bit in array elements that consist of a maximum of 256 bits. | 2-374 |
|  | BitCnt | Bit Counter | Counts the number of TRUE bits in a bit string. | 2-376 |
|  | ColmToLine_** | Column to Line Conversion Group | Extracts bit values from the specified position of array elements and outputs them as a bit string. | 2-377 |
|  | LineToColm | Line to Column Conversion | Takes the bits from a bit string and outputs them to the specified bit position in array elements. | 2-379 |
|  | Gray | Gray Code Conversion | Converts a gray code into an angle. | 2-381 |
|  | PWLApprox | Broken Line Approximation | Performs broken line approximations for integers or real numbers. | 2-384 |
|  | MovingAverage | Moving Average | Calculates a moving average. | 2-387 |
|  | PIDAT | PID with Autotuning | Performs PID control with autotuning (2-PID control with set point filter). | 2-393 |
|  | DispartReal | Separate Mantissa and Exponent | Separates a real number into the signed mantissa and the exponent. | 2-418 |
|  | UniteReal | Combine Real Number Mantissa and Exponent | Combines a signed mantissa and exponent to make a real number. | 2-421 |
|  | NumToDecString | Fixed-length Decimal Text String Conversion | Converts an integer to a fixed-length decimal text string. | 2-423 |
|  | NumToHexString | Fixed-length Hexadecimal Text String Conversion | Converts an integer to a fixed-length hexadecimal text string. | 2-423 |
|  | HexStringToNum_** | Hexadecimal Text String-to-Number Conversion Group | Converts a hexadecimal text string to an integer. | 2-426 |
|  | FixNumToString | Fixed-decimal Number-to-Text String Conversion | Converts a signed fixed-decimal number to a decimal text string. | 2-428 |
|  | StringToFixNum | Text String-to-Fixed-decimal Conversion | Converts a decimal text string to a signed fixed-decimal number. | 2-430 |
|  | DtToString | Date and Time-toText String Conversion | Converts a date and time to a text string. | 2-433 |
|  | DateToString | Date-to-Text String Conversion | Converts a date to a text string. | 2-435 |
|  | TodToString | Time of Day-toText String Conversion | Converts a time of day to a text string. | 2-436 |
|  | GrayToBin_** | Gray Code-toBinary Code Conversion Group | Converts a gray code to a bit string. | 2-438 |
|  | BinToGray_** | Binary Code-toGray Code Conversion | Converts a bit string to a gray code. | 2-438 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Conversion Instructions | StringToAry | Text String-to-Array Conversion | Converts a text string to a BYTE array. | 2-441 |
|  | AryToString | Array-to-Text String Conversion | Converts a BYTE array to a text string. | 2-443 |
|  | DispartDigit | Four-bit Separation | Separates a bit string into 4-bit units. | 2-445 |
|  | UniteDigit_** | Four-bit Join Group | Joins 4-bit units of data into a bit string. | 2-447 |
|  | Dispart8Bit | Byte Data Separation | Separates a bit string into individual bytes. | 2-449 |
|  | Unite8Bit_** | Byte Data Join Group | Joins bytes of data into a bit string. | 2-451 |
|  | ToAryByte | Conversion to Byte Array | Separates the value of a variable into bytes and stores them in a BYTE array. | 2-453 |
|  | AryByteTo | Conversion from Byte Array | Joins BYTE array elements and stores the result in a variable. | 2-458 |
|  | SizeOfAry | Get Number of Array Elements | Gets the number of elements in an array. | 2-463 |
| Stack and Table Instructions | StackPush | Push onto Stack | Stores a value in a stack. | 2-466 |
|  | StackFIFO | First In First Out | Removes the bottom value from a stack. | 2-475 |
|  | StackLIFO | Last In First Out | Removes the top value from a stack. | 2-475 |
|  | StackIns | Insert into Stack | Inserts a value at a specified position in a stack. | 2-478 |
|  | StackDel | Delete from Stack | Deletes a value from a specified position in a stack. | 2-480 |
|  | RecSearch | Record Search | Searches an array of structures for elements that match the search key with the specified method. | 2-482 |
|  | RecRangeSearch | Range Record Search | Searches an array of structures for elements that match the search condition range with the specified method. | 2-487 |
|  | RecSort | Record Sort | Sorts the elements of an array of structures. | 2-492 |
|  | RecNum | Get Number of Records | Finds the number of records in an array of structures to the end data. | 2-497 |
|  | RecMax | Maximum Record Search | Searches the specified member in the structures of an array of structures for the maximum value. | 2-499 |
|  | RecMin | Minimum Record Search | Searches the specified member in the structures of an array of structures for the minimum value. | 2-499 |
| FCS Instructions | StringSum | Checksum Calculation | Calculates the checksum for a text string. | 2-504 |
|  | StringLRC | Calculate Text String LRC | Calculates the LRC value (horizontal parity). | 2-506 |
|  | StringCRCCCITT | Calculate Text <br> String CRC-CCITT | Calculates the CRC-CCITT value using the XMODEM method. | 2-508 |
|  | StringCRC16 | Calculate Text String CRC-16 | Calculates the CRC-16 value using the MODBUS method. | 2-510 |
|  | AryLRC_** | Calculate Array LRC Group | Calculates the LRC value for an array | 2-512 |
|  | AryCRCCCITT | Calculate Array CRC-CCITT | Calculates the CRC-CCITT value using the XMODEM method. | 2-514 |
|  | AryCRC16 | Calculate Array CRC-16 | Calculates the CRC-16 value using the MODBUS method. | 2-516 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Text String Instructions | CONCAT | Concatenate String | Joins two to five text strings. | 2-520 |
|  | LEFT | Get String Left | Extracts a text string with the specified number of characters from the start (left) of a text string. | 2-522 |
|  | RIGHT | Get String Right | Extracts a text string with the specified number of characters from the end (right) of a text string. | 2-522 |
|  | MID | Get String Any | Extracts a text string with the specified number of characters from the specified character position. | 2-524 |
|  | FIND | Find String | Searches a specified text string for the position of a specified text string. | 2-526 |
|  | LEN | String Length | Finds the number of characters in a text string. | 2-528 |
|  | REPLACE | Replace String | Replaces part of a text string with another text string | 2-529 |
|  | DELETE | Delete String | Deletes all or part of a text string. | 2-531 |
|  | INSERT | Insert String | Inserts a text string into another text string. | 2-533 |
|  | GetByteLen | Get Byte Length | Counts the number of bytes in a text string. | 2-535 |
|  | ClearString | Clear String | Clears a text string. | 2-537 |
|  | ToUCase | Convert to Uppercase | Converts all single-byte letters in a text string to uppercase. | 2-538 |
|  | ToLCase | Convert to Lowercase | Converts all single-byte letters in a text string to lowercase. | 2-538 |
|  | TrimL | Trim String Left | Removes blank space from the beginning of a text string. | 2-540 |
|  | TrimR | Trim String Right | Removes blank space from the end of a text string. | 2-540 |
| Time and Time of Day Instructions | ADD_TIME | Add Time | Adds two times. | 2-544 |
|  | ADD_TOD_TIME | Add Time to Time of Day | Adds a time to a time of day. | 2-546 |
|  | ADD_DT_TIME | Add Time to Date and Time | Adds a time to a date and time. | 2-548 |
|  | SUB_TIME | Subtract Time | Subtracts one time from another. | 2-550 |
|  | SUB_TOD_TIME | Subtract Time from Time of Day | Subtracts a time from a time of day. | 2-552 |
|  | SUB_TOD_TOD | Subtract Time of Day | Subtracts a time of day from another time of day. | 2-554 |
|  | SUB_DATE_DATE | Subtract Date | Subtracts another date from another date. | 2-555 |
|  | SUB_DT_DT | Subtract Date and Time | Subtracts another date and time from another date and time. | 2-556 |
|  | SUB_DT_TIME | Subtract Time from Date and Time | Subtracts a time from a date and time. | 2-558 |
|  | MULTIME | Multiply Time | Multiplies a time by a specified number. | 2-560 |
|  | DIVTIME | Divide Time | Divides a time by a specified number. | 2-562 |
|  | CONCAT_DATE_TOD | Concatenate Date and Time of Day | Combines a date and a time of day. | 2-564 |
|  | DT_TO_TOD | Extract Time of Day from Date and Time | Extracts the time of day from a date and time. | 2-566 |
|  | DT_TO_DATE | Extract Date from Date and Time | Extracts the date from a date and time. | 2-568 |
|  | SetTime | Set Time | Sets the system time. | 2-570 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Time and Time of Day Instructions | GetTime | Get Time of Day | Reads the current time. | 2-572 |
|  | DtToSec | Convert Date and Time to Seconds | Converts a date and time to the number of seconds from 00:00:00 on January 1, 1970. | 2-574 |
|  | DateToSec | Convert Date to Seconds | Converts a date to the number of seconds from 00:00:00 on January 1, 1970. | 2-576 |
|  | TodToSec | Convert Time of Day to Seconds | Converts a time of day to the number of seconds from 00:00:00. | 2-577 |
|  | SecToDt | Convert Seconds to Date and Time | Converts the number of seconds from 00:00:00 on January 1, 1970 to a date and time. | 2-578 |
|  | SecToDate | Convert Seconds to Date | Converts the number of seconds from 00:00:00 on January 1, 1970 to a date. | 2-580 |
|  | SecToTod | Convert Seconds to Time of Day | Converts the number of seconds from 00:00:00 to a time of day. | 2-582 |
|  | TimeToNanoSec | Convert Time to Nanoseconds | Converts a time to nanoseconds. | 2-583 |
|  | TimeToSec | Convert Time to Seconds | Converts a time to seconds. | 2-584 |
|  | NanoSecToTime | Convert <br> Nanoseconds to Time | Converts nanoseconds to a time. | 2-585 |
|  | SecToTime | Convert Seconds to Time | Converts seconds to a time. | 2-586 |
|  | ChkLeapYear | Check for Leap Year | Checks for a leap year. | 2-588 |
|  | GetDaysOfMonth | Get Days in Month | Gets the number of days in the specified month. | 2-589 |
|  | DaysToMonth | Convert Days to Month | Calculates the month based on the number of days from January 1. | 2-591 |
|  | GetDayOfWeek | Get Day of Week | Gets the day of the week for the specified year, month, and day of month. | 2-593 |
|  | GetWeekOfYear | Get Week Number | Gets the week number for the specified year, month, and day of month. | 2-595 |
|  | DtToDateStruct | Break Down Date and Time | Converts a date and time to the year, month, day, hour, minutes, seconds, and nanoseconds. | 2-597 |
|  | DateStructToDt | Join Time | Joins a year, month, day, hour, minutes, seconds, and nanoseconds into a date and time. | 2-599 |
| System Control Instructions | TraceSamp | Data Trace Sampling | Performs sampling for a data trace. | 2-602 |
|  | TraceTrig | Data Trace Trigger | Generates a trigger for data tracing. | 2-605 |
|  | GetTraceStatus | Read Data Trace Status | Reads the execution status of a data trace. | 2-607 |
|  | SetAlarm | Create Userdefined Error | Creates a user-defined error. | 2-610 |
|  | ResetAlarm | Reset Userdefined Error | Resets a user-defined error. | 2-615 |
|  | GetAlarm | Get User-defined Error Status | Gets the highest event level (of user-defined error levels 1 to 8 ) and the highest level event code of the current user-defined errors. | 2-617 |
|  | ResetPLCError | Reset PLC Controller Error | Resets errors in the PLC Function Module. | 2-619 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| System Control Instructions | GetPLCError | Get PLC Controller Error Status | Gets the highest level status (partial fault or minor fault) and highest level event code of the current Controller errors in the PLC Function Module. | 2-622 |
|  | ResetCJBError | Reset CJ Bus Controller Error | Resets a Controller Error in the I/O bus. | 2-624 |
|  | GetCJBError | Get I/O Bus Error Status | Gets the highest level status (partial fault or minor fault) and highest level event code of the current Controller errors in the I/O bus. | 2-626 |
|  | GetEIPError | Get EtherNet/IP Error Status | Gets the highest level status (partial fault or minor fault) and highest level event code of the current Controller errors in the EtherNet/IP Function Module. | 2-628 |
|  | ResetMCError | Reset Motion Control Error | Resets a Controller Error in the Motion Control Function Module. | 2-630 |
|  | GetMCError | Get Motion Control Error Status | Gets the highest level status (partial fault or minor fault) and highest level event code of the current Controller errors in the Motion Control Function Module. | 2-634 |
|  | ResetECError | Reset EtherCAT Error | Resets a Controller Error in the EtherCAT Master Function Module. | 2-636 |
|  | GetECError | Get EtherCAT Error Status | Gets the highest level status (partial fault or minor fault) and highest level event code of the current communications port errors or master errors in the EtherCAT Master Function Module. | 2-637 |
|  | SetInfo | Create Userdefined Information | Creates user-defined information. | 2-639 |
|  | ResetUnit | Restart Unit | Restarts a CPU Bus Unit or Special I/O Unit. | 2-641 |
|  | GetNTPStatus | Read NTP Status | Reads the NTP status. | 2-645 |
| Communications Instructions | ExecPMCR | Protocol Macro | Requests execution of a communications sequence (protocol data) registered in a Serial Communications Unit (unit version 2.2 or later). | 2-648 |
|  | SerialSend | SCU Send Serial | Sends data in No-protocol Mode from a serial port on a Serial Communications Unit. | 2-658 |
|  | SerialRcv | SCU Receive Serial | Receives data in No-protocol Mode from a serial port on a Serial Communications Unit. | 2-665 |
|  | SendCmd | Send Command | Uses a serial gateway and sends a command to a Serial Communications Unit. Or, sends an explicit command to a DeviceNet Unit. | 2-674 |
|  | CIPOpen | Open CIP Class 3 Connection | Opens a CIP class 3 connection with the specified remote node. | 2-684 |
|  | CIPRead | Read Variable Class 3 Explicit | Uses a class 3 explicit message to read the value of a variable in another Controller on a CIP network. | 2-692 |
|  | CIPWrite | Write Variable Class 3 Explicit | Uses a class 3 explicit message to write the value of a variable in another Controller on a CIP network. | 2-696 |
|  | CIPSend | Send Explicit Message Class 3 | Sends a class 3 CIP message to a specified device on a CIP network. | 2-701 |
|  | CIPClose | Close CIP Class 3 Connection | Closes the CIP class 3 connection to the specified handle. | 2-704 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| Communications Instructions | CIPUCMMRead | Read Variable UCMM Explicit | Uses a UCMM explicit message to read the value of a variable in another Controller on the specified CIP network. | 2-706 |
|  | CIPUCMMWrite | Write Variable UCMM Explicit | Uses a UCMM explicit message to write the value of a variable in another Controller on a CIP network. | 2-710 |
|  | CIPUCMMSend | Send Explicit Message UCMM | Sends a UCMM CIP message to a specified device on a CIP network. | 2-716 |
|  | EC_CoESDOWrite | Write EtherCAT CoE SDO | Writes a value to a CoE object of a specified slave on the EtherCAT network. | 2-726 |
|  | EC_CoESDORead | Read EtherCAT CoE SDO | Reads a value from a CoE object of a specified slave. | 2-729 |
|  | EC_StartMon | Start EtherCAT Packet Monitor | Starts packet monitoring of EtherCAT communications. | 2-734 |
|  | EC_StopMon | Stop EtherCAT Packet Monitor | Stops execution of packet monitoring. | 2-740 |
|  | EC_SaveMon | Save EtherCAT Packets | Saves EtherCAT communications packet data to an internal file in the main memory of the CPU Unit. | 2-742 |
|  | EC_CopyMon | Transfer EtherCAT Packets | Transfers packet data in an internal file in the main memory of the CPU Unit to a SD Memory Card. | 2-744 |
|  | EC_DisconnectSlave | Disconnect <br> EtherCAT Slave | Disconnects the specified slave from the network. | 2-746 |
|  | EC_ConnectSlave | Connect EtherCAT Slave | Connects the specified slave to the EtherCAT network. | 2-752 |
|  | SktUDPCreate | Create UDP Socket | Creates a UDP socket request to open a servo port for the built-in EtherNet/IP. | 2-754 |
|  | SktUDPRcv | UDP Socket Receive | Reads the data from the receive buffer for a UDP socket for the built-in EtherNet/IP. | 2-761 |
|  | SktUDPSend | UDP Socket Send | Sends data from a UDP port for the built-in EtherNet/IP. | 2-764 |
|  | SktTCPAccept | Accept TCP <br> Socket | Requests accepting a TCP socket for the builtin EtherNet/IP. | 2-767 |
|  | SktTCPConnect | Connect TCP Socket | Connects to a remote TCP port from the builtin EtherNet/IP. | 2-770 |
|  | SktTCPRcv | TCP Socket Receive | Reads the data from the receive buffer for a TCP socket for the built-in EtherNet/IP. | 2-777 |
|  | SktTCPSend | TCP Socket Send | Sends data from a TCP port for the built-in EtherNet/IP. | 2-780 |
|  | SktGetTCPStatus | Read TCP Socket Status | Reads the status of a TCP socket. | 2-783 |
|  | SktClose | Close TCP/UDP Socket | Closes the specified TCP or UDP socket for the built-in EtherNet/IP. | 2-786 |
|  | SktClearBuf | Clear TCP/UDP Socket Receive Buffer | Clears the receive buffer for the specified TCP or UDP socket for the built-in EtherNet/IP. | 2-789 |

| Type | Instruction | Name | Function | Page |
| :---: | :---: | :---: | :---: | :---: |
| SD Memory Card Instructions | FileWriteVar | Write Variable to File | Writes the value of a variable to the specified file in the SD Memory Card. The value is written in binary format. | 2-794 |
|  | FileReadVar | Read Variable from File | Reads the contents of the specified file on the SD Memory Card as binary data and writes it to a variable. | 2-799 |
|  | FileOpen | Open File | Opens the specified file in the SD Memory Card. | 2-803 |
|  | FileClose | Close File | Closes the specified file in the SD Memory Card. | 2-806 |
|  | FileSeek | Seek File | Sets a file position indicator in the specified file in the SD Memory Card. | 2-809 |
|  | FileRead | Read File | Reads the data from the specified file in the SD Memory Card. | 2-812 |
|  | FileWrite | Write File | Writes data to the specified file in the SD Memory Card. | 2-819 |
|  | FileGets | Get Text String | Reads a text string of one line from the specified file in the SD Memory Card. | 2-826 |
|  | FilePuts | Put Text String | Writes a text string to the specified file in the SD Memory Card. | 2-833 |
|  | FileCopy | Copy File | Copies the specified file in the SD Memory Card. | 2-840 |
|  | FileRemove | Delete File | Deletes the specified file from the SD Memory Card. | 2-848 |
|  | FileRename | Change File Name | Changes the name of the specified file or directory in the SD Memory Card. | 2-852 |
|  | DirCreate | Create Directory | Creates a directory with the specified name in the SD Memory Card. | 2-857 |
|  | DirRemove | Delete Directory | Deletes the specified directory from the SD Memory Card. | 2-860 |
| Other Instructions | ReadNbit_** | N-bit Read Group | Reads zero or more bits from a bit string. | 2-864 |
|  | WriteNbit_** | N-bit Write Group | Writes zero or more bits to a bit string. | 2-866 |
|  | ChkRange | Check Subrange Variable | Determines if the value of a variable is within the valid range of the range type specification. | 2-868 |
|  | GetMyTaskStatus | Read Current Task Status | Reads the status of the current task. | 2-870 |
|  | Task_IsActive | Determine Task Status | Determines if the specified task is currently in execution. | 2-873 |
|  | Lock | Lock Tasks | Starts an exclusive lock between tasks. Execution of any other task with a lock region with the same lock number is disabled. | 2-875 |
|  | Unlock | Unlock Tasks | Stops an exclusive lock between tasks. | 2-875 |
|  | Get**Clk | Get Clock Pulse Group | Outputs a clock pulse at the specified cycle. | 2-880 |
|  | Get**Cnt | Get Incrementing Free-running Counter Group | Gets the values of free-running counters of the specified cycle. | 2-881 |

- Refer to the NJ-series Motion Control Instructions Reference Manual (Cat. No. W508) for the specifications of the motion control instructions.
- Refer to the Sysmac Studio Version 1 Operation Manual (Cat. No. W504) for the specifications of the simulation instructions.

## Instruction Descriptions

This section describes the specifications of the instructions that you can use with NJseries Controllers.
Using this Section ..... 2-2
Ladder Diagram Instructions ..... 2-13
ST Statement Instructions ..... 2-23
Sequence Input Instructions ..... 2-39
Sequence Output Instructions ..... 2-45
Sequence Control Instructions ..... 2-59
Comparison Instructions ..... 2-83
Timer Instructions ..... 2-115
Counter Instructions ..... 2-133
Math Instructions ..... 2-151
BCD Conversion Instructions ..... 2-211
Data Type Conversion Instructions ..... 2-231
Bit String Processing Instructions ..... 2-285
Selection Instructions ..... 2-297
Data Movement Instructions ..... 2-317
Shift Instructions ..... 2-351
Conversion Instructions ..... 2-367
Stack and Table Instructions ..... 2-465
FCS Instructions ..... 2-503
Text String Instructions ..... 2-519
Time and Time of Day Instructions ..... 2-543
System Control Instructions ..... 2-601
Communications Instructions ..... 2-647
SD Memory Card Instructions ..... 2-793
Other Instructions ..... 2-863

## Using this Section

The notation used to describe instructions in this section is explained below.

## Items

The following items are provided.

The instruction option, upward differentiation specification, and instance specification are described below.
Instruction option:
Support for the instruction option is indicated by "(@)" before the FUN instruction. If support for the instruction option is indicated, you can place " @" before the instruction word to specify upward differentiation. Also, you can place "\%" before the instruction word to specify downward differentiation. An instruction for which upward differentiation is specified is executed when the value of the EN input variable was FALSE in the previous task period and is TRUE in the current task period. An instruction for which downward differentiation is specified is executed when the value of the EN input variable was TRUE in the previous task period and is FALSE in the current task period.
Upward differentiation specification:
This is indicated by the arrow pointing into the instruction at the entry point of the input variable. Instructions with this specification operate as upwardly differentiated instructions.

## Instance specification:

An instance of an instruction is indicated by "XX_instance" above an FB instruction. You must assign an instance name to any instance of an instruction that you specify.

| Item | Description |
| :---: | :---: |
| ST expression | The notation that represents the instruction in ST is given. <br> There are two ways that you can use to code an instruction in ST. These are described below. <br> 1. Directly Specifying the Correspondence between the Parameters and the Input, Output, and InOut Variables <br> Example: MoveBit(In:=abc, InPos:=def, InOut:=ghi, InOutPos:=jkl); <br> 2. Specifying Only the Parameters and Omitting the Input, Output, and In-Out Variables Example: MoveBit(In, InPos, InOut, InOutPos); <br> Method 2 is used in this section. <br> You must assign an instance name to any instruction that is given as "XX_instance(variable_name)." <br> Example: TON_instance (In, PT, Q, ET); |
| Variables | - Name <br> The input variables, output variables, and in-out variables are given. <br> Example: In1 <br> However, variables that are used by many instructions are not given on the pages that describe individual instructions. The following eight variables are commonly used. The specifications of these variables are given later. <br> (EN, ENO, Execute, Done, Busy, Error, ErrorID, and ErrorIDEx) <br> - Meaning <br> The name of the variable is given. <br> Example: Up-counter <br> - I/O <br> Whether the variable is an input variable, output variable, or in-out variable is given. <br> - Description <br> The meaning of the variable and any restrictions are given. <br> - Valid range <br> The range that the variable can take is given. "Depends on data type" indicates that the valid range of the variable depends on the data type that you use. The valid ranges of the data types are given later in this section. <br> - Unit <br> The unit of the value that is specified with the variable is given. "---" indicates that there is no unit. Example: Bytes <br> - Default <br> The specified default value is automatically used for the variable if you do not assign a parameter to the instruction before it is executed. <br> "---" indicates the following: <br> Input variables: The default value of the data type of the input variable is assigned. The default values of the data types are given later in this section. If the input variable is a structure, the default value is given in the specifications of the structure in the description of the function of the instruction. <br> Output variables: Default values are not set. <br> In-out variables: Default values are not set. <br> - Data type <br> The data type of the variable is given. The use of enumerations, arrays, structures, and unions is also given. |
| Function | The function of the instruction is described. Variable names are given in italic text. <br> Example: In1 <br> Array names are followed by "[]". <br> Example: InOut[] |
| Related Systemdefined Variables | The system-defined variables that are related to the instruction are given. Refer to the NJ -series CPU Unit Software User's Manual (Cat. No. W501) for details on system-defined variables. |
| Related Semi-userdefined Variables | The semi-user-defined variables and variable names that are related to the instruction are given. Refer to the specified manuals for details on semi-user-defined variables. |

| Item | Description |
| :--- | :--- |
| Additional Information | Additional information on the function of the instruction is provided. This includes related instruc- <br> tions and helpful information for application of the instruction. |
| Precautions for Cor- <br> rect Use | Precautions for application of the instruction are given. The conditions under which errors occur for <br> the instruction are also given here. |
| Sample Programming | Short samples of how to use the instruction in an application program are provided. The ladder dia- <br> gram and ST for the same process are shown. |

## Common Variables

The specifications of variables that are used for many instructions (EN, ENO, Execute, Done, Busy, Error, ErrorID, and ErrorIDEx) are described below. These variables are not described in the tables of variables for individual instructions. Check the graphic or ST expression for the instruction to see if an instruction uses these variables.

## EN

$E N$ is an input variable that gives the execution condition for a FUN instruction.
When you use a FUN instruction in a ladder diagram, connect the execution condition to EN.

| Name | Meaning | I/O | Description | Data type | Valid range | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| EN | Enable (Execu- <br> tion Condition) | Input | TRUE: Instruction is executed. <br> FALSE: Instruction is not executed. | BOOL | TRUE or <br> FALSE | TRUE |

[^0]- FB instructions do not have an EN input variable.
- When you call a FUN instruction from structured text, omit the $E N$ input variable. The $E N$ input variable is not required in structured text because the execution condition for the instruction is determined by the operation sequence.

## ENO

The ENO output variable passes the execution to the next instruction in a ladder diagram. Normally, when instruction execution is completed, the value of ENO changes to TRUE. Execution of the next instruction is then started.

| Name | Meaning | I/O | Description | Data type | Valid range | Default |
| :--- | :--- | :---: | :--- | :--- | :--- | :---: |
| ENO | Enable Output | Output | TRUE: Normal end. <br> FALSE: Error end, execution in <br> progress, or execution <br> condition not met. | BOOL | TRUE or <br> FALSE | --- |

[^1]
## Execute, Done, and Busy

Execute is an input variable that gives the execution condition for some FB instructions.
Instruction execution starts when Execute changes to TRUE. After Execute changes to TRUE, execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the instruction execution time exceeds the task period.
Done is an output variable that shows the completion of execution for some FB instructions.
Busy is an output variable that shows that instruction execution is in progress for some FB instructions.

| Name | Meaning | I/O | Description | Data type | Valid range | Initial value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Execute | Execute | Input | TRUE: Instruction is executed. ${ }^{* 1}$ FALSE: Instruction is not executed. ${ }^{*} 2$ | BOOL | TRUE or FALSE | FALSE |
| Done | Done | Output | TRUE: Normal end. ${ }^{*} 3^{*} 4$ <br> FALSE: Error end, execution in progress, or execution condition not met. | BOOL | TRUE or FALSE | --- |
| Busy | Busy |  | TRUE: Execution processing is in progress. <br> FALSE: Execution processing is not in progress. |  |  |  |

*1 If the value of Execute is already TRUE when Controller operation starts, the instruction is not executed. To execute the instruction in that case, first change the value of Execute to FALSE.
*2 Processing is completed to the end even if Execute changes to FALSE during execution.
*3 The value of Done changes to FALSE when the execution condition is no longer met after a normal end.
*4 If the execution condition is no longer met when a normal end occurs, the value of Done is TRUE for one task period and it then changes to FALSE.

## Error, ErrorID, and ErrorIDEx

Error, ErrorID, and ErrorIDEx are output variables that show that an error occurred in the execution of some FB instructions.

| Name | Meaning | I/O | Description | Data type | Valid range | Initial value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Error | Error | Output | TRUE: Error end. ${ }^{*}{ }^{*} 2$ <br> FALSE: Normal end, execution in progress, or execution condition not met. | BOOL | TRUE or FALSE | --- |
| ErrorlD | Error code |  | This is the error ID for an error end. The value is WORD\#16\#0 for a normal end. | WORD | Depends on the instruction. |  |
| ErrorIDEx | Expansion error code |  | This is the error ID for an Expansion Unit Hardware Error. <br> The value is DWORD\#16\#0 for a normal end. | DWORD |  |  |

[^2]Timing charts are provided below for Execute, Done, Busy, Error, ErrorID, and ErrorIDEx.

## - Normal End

Instruction processing continues to the end even if Execute changes to FALSE during execution (when Busy is TRUE).

Execute changed to FALSE, so Done changes to FALSE.

Normal end. Busy changes to FALSE and Done changes to TRUE. Error does not change (remains FALSE).

## - Error End

Error end. Busy changes to FALSE and Error changes to TRUE. Done does not change (remains FALSE). ErrorID and ErrorIDEx output error IDs.

## Valid Ranges and Default Values of Variables

The valid range of a variable indicates the range of values that variable can take. The default value of a variable indicates the value that is assigned to an input variable when the instruction is executed without a parameter assigned to the input variable. These values are defined for each data type. If specific values are not given for an instruction, then the valid ranges and default values of the data types are applied. These variables are indicated by "depends on data type" in the valid range column and by "---" in the input variable default column. The valid ranges and default values of the data types are given in the following tables.

| Classifica- <br> tion | Data <br> type | Valid range | Default |
| :--- | :--- | :--- | :--- |
| Boolean | BOOL | TRUE or FALSE | FALSE |
| Bit string | BYTE | BYTE\#16\#00 to FF | BYTE\#16\#00 |
|  | WORD | WORD\#16\#0000 to FFFF | WORD\#16\#0000 |
|  | DWORD | DWORD\#16\#00000000 to FFFFFFFF | DWORD\#16\#0000_0000 |
|  | LWORD | LWORD\#16\#0000000000000000 to <br> FFFFFFFFFFFFFFFF | LWORD\#16\#0000_0000_0000_0000 |

| Classification | Data type | Valid range | Default |
| :---: | :---: | :---: | :---: |
| Integers | USINT | USINT\#0 to +255 | USINT\#0 |
|  | UINT | UINT\#0 to +65535 | UINT\#0 |
|  | UDINT | UDINT\#0 to +4294967295 | UDINT\#0 |
|  | ULINT | ULINT\#0 to +18446744073709551615 | ULINT\#0 |
|  | SINT | SINT\#-128 to +127 | SINT\#0 |
|  | INT | INT\#-32768 to +32767 | INT\#0 |
|  | DINT | DINT\#-2147483648 to +2147483647 | DINT\#0 |
|  | LINT | LINT\#-9223372036854775808 to +9223372036854775807 | LINT\#0 |
| Real numbers | REAL | REAL\#-3.402823e+38 to -1.175494e-38, <br> 0 , $+1.175494 \mathrm{e}-38 \text { to }+3.402823 \mathrm{e}+38$ $+\infty /-\infty$ | REAL\#0 |
|  | LREAL | LREAL\#-1.79769313486231e+308 to $-2.22507385850720 \mathrm{e}-308$, <br> 0 , <br> $+2.22507385850720 \mathrm{e}-308$ to $+1.79769313486231 \mathrm{e}+308$, $+\infty /-\infty$ | LREAL\#0 |
| Times, durations, dates, and text strings | TIME | T\#-9223372036854.775808ms <br> (T\#-106751d_23h_47m_16s_854.775808ms) to T\#9223372036854.775807ms <br> (T\#+106751d_23h_47m_16s_854.775807ms) | T\#0s |
|  | DATE | D\#1970-01-01 to D\#2106-02-06 (January 1, 1970 to February 6, 2106) | D\#1970-01-01 |
|  | TOD | TOD\#00:00:00.000000000 to TOD\#23:59:59.999999999 ( $0: 00$ and 0.000000000 to $23: 59$ and 59.999999999 seconds) | TOD\#00:00:00.000000000 |
|  | DT | DT\#1970-01-01-00:00:00.000000000 to DT\#2106-02-06-23:59:59.999999999 <br> (0:00 and 0.000000000 on January 1, 1970 to 23:59 and 59.999999999 seconds on February 6, 2106) | DT\#1970-01-01-00:00:00.000000000 |
|  | STRING | Character code: UTF-8 <br> 0 to 1,986 bytes ( 1,985 single-byte alphanumeric characters plus the final NULL character) | " |

## Derivative Data Types（Enumerations，Structures，and Unions）

Variables that use derivative data types（enumerations，structures，and unions）are specified as such in the tables of variable data types．The notation is described below．

## Enumerations

The data type for an enumerated variable is given within the table．The following is an example．Here， the data type of the Out variable is enumerated type＿eDAYOFWEEK．The enumerators are described in the description of the function of the instruction．

## Structures and Unions

The data type for a structure or union variable is given within the table．The following is an example． Here，the data type of the In1 variable is structure＿sPORT．Details on the members of a structure or union are given in the description of the function of the instruction．

|  | $\begin{aligned} & \text { O} \\ & \frac{0}{0} \\ & \stackrel{0}{0} \\ & \end{aligned}$ |  | it s | ngs |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \mathrm{a} \end{aligned}$ | $\begin{aligned} & \text { dur } \\ & \text { d te } \end{aligned}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 罥 } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 四 } \\ & \text { 而 } \end{aligned}$ | ミ | $\begin{aligned} & \text { D } \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{2}}_{\substack{C}}$ |  |  | $\frac{\mathrm{C}}{\underset{i}{2}}$ | $\sum_{-1}^{\infty}$ | $\bar{\Sigma}_{\boldsymbol{j}}$ | $\frac{0}{2}$ | $\sum_{-1}^{\Gamma}$ | $\xrightarrow{\text { m }}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \end{aligned}$ | $\stackrel{-1}{3}$ | 号 | －1 | 먹 |  |
| In1 |  |  |  |  |  | fef | F | ction | for | etail | on | st | tu | sP |  |  |  |  |  |  |

The tables also indicate any variables for which you can specify a structure，a structure member，a union，or a union member as the parameter．
In the following example，you can specify a parameter with a basic data type，or you can specify a struc－ ture，a structure member，a union，or a union member for the In1 variable．To specify a structure or union，specify only the structure or the union as the parameter．To specify a structure member or a union member，specify the member as the parameter．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { ㅇ } \end{aligned}$ |  | $\sum_{0}^{0}$ | 믕 O O | $\sum_{\substack{\Gamma}}^{\substack{\text { D}}}$ | $\underset{\underset{Z}{\infty}}{\substack{C}}$ | $\underset{\substack{C}}{\substack{\text { n }}}$ |  | $\underset{\underset{1}{c}}{\stackrel{C}{E}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\mathrm{Z}}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 另 } \\ & \text { 而 } \end{aligned}$ | $\underset{\substack{-1 \\ \hline}}{\substack{n}}$ | $\begin{aligned} & \text { 号 } \\ & \hline 1 \end{aligned}$ | -1 | 익 |  |
| $\ln 1$ | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
|  | A structure，structure member，union，or union member can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Array Specifications

Array variable names are followed by＂［］＂and＂（array）＂is specified．For these variables，specify an ele－ ment of the array（i．e．，specify the subscript）as the parameter．
An example is shown below．Here，the table shows that $\operatorname{In1}[]$ is a BYTE array．

The data type table indicates the arrays for which structures and unions can be used as elements，as shown in the following example．For these variables，specify an element of the array（i．e．，specify the subscript）as the parameter．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 四 } \\ & \text { 亩 } \end{aligned}$ | ミ | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \Gamma \\ & \sum_{0}^{5} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{2}}_{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{0_{i}^{C}}{\underset{1}{2}}$ | $\frac{\mathrm{C}}{\underset{\sim}{\mathrm{C}}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\sum_{i}$ | $\underset{\sim}{\text { 윽 }}$ | $\sum_{-1}^{\Gamma}$ | $$ | $\begin{aligned} & \text { 芴 } \\ & \text { m } \end{aligned}$ | － | 号 | 응 | 억 | 第 |
| $\ln 1[]$（array） | Arrays of structures or unions can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

The table indicates any variables for which you can specify either an array or an array element as the parameter．
In the following example，you can specify a parameter with a basic data type，or you can specify an array or an array element．To specify an array，specify only the array as the parameter．To specify an array element，specify an element of the array（i．e．，specify the subscript）as the parameter．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O | $\begin{aligned} & \text { D } \\ & \text { 구N } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 $\sum_{0}^{0}$ D | $\sum_{0}^{\Gamma}$ 0 0 | $\underset{\underset{Z}{\infty}}{\substack{C}}$ | $\sum_{-1}^{\subseteq}$ | $\underset{\text { 득 }}{\text { 든 }}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\sim}{\text { 믄 }}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { ग } \\ & \text { 苋 } \end{aligned}$ | 「 mim \％ | －긏 | \％ | －${ }^{-1}$ | 먹 | 0 翤 0 |
| In1 | An array or array element can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Others

## Errors Detected for All Instructions

The errors that can occur for an instruction are given in the Precautions for Correct Use section．The fol－ lowing three errors，however，can be detected for any instruction．They are not listed in the Precautions for Correct Use sections．
－Reading or writing elements that exceed the range of an array variable． Example：Setting $a[4]$ for an input variable for the array variable $a[0 . .3]$ ．
－Passing parameters that are not variables to instructions for which array variables are defined for input，output，or in－out variables．
－Assigning a text string that is longer than the defined number of bytes to a STRING variable．
－Assigning a text string that does not end in a NULL character to a STRING variable．

- Assigning a text string that has character code error to a STRING variable.
- Dividing an integer variable by 0 .

## Precautions for All Instructions

The amount of processing that is required for some instructions depends on the parameters that you connect. If there is too much processing, the instruction execution time increases and the task period may be exceeded. This will result in a Task Period Exceeded error. Adjust the amount of processing to a suitable amount.

2 Instruction Descriptions

## Ladder Diagram Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| LD and LDN | Load/ <br> Load NOT | $2-14$ |
| AND and ANDN | AND/ <br> AND NOT | $2-16$ |
| OR and ORN | OR/ <br> OR NOT | $2-18$ |
| Out and OutNot | Output/ <br> Output NOT | $2-20$ |

## LD and LDN

LD: Reads the value of a BOOL variable.
LDN: Reads the inverse of the value of a BOOL variable.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| LD | Load | --- |  | None |
| LDN | Load NOT | --- |  | None |

## Variables

None

## Function

- LD

The LD instruction reads the value of the specified BOOL variable and outputs it to the next instruction. If the value of the specified variable is TRUE, then TRUE is output. If the value is FALSE, then FALSE is output. Use the LD instruction for the first NO bit from the bus bar or for the first NO bit of a logic block.

## - LDN

The LD instruction reads the inverse of the value of the specified BOOL variable and outputs it to the next instruction. If the value of the specified variable is TRUE, then FALSE is output. If the value is FALSE, then TRUE is output. Use the LDN instruction for the first NC bit from the bus bar or for the first NC bit of a logic block.
The operation is as shown below if you do not specify upward or downward differentiation.

| Instruction | Value of <br> variable | Output <br> value |
| :--- | :--- | :--- |
| LD | TRUE | TRUE |
|  | FALSE | FALSE |
| LDN | TRUE | FALSE |
|  | FALSE | TRUE |

If you specify upward or downward differentiation, the operation depends on the following: the value of the variable the last time the instruction was executed and the current value of the variable. This is shown below.

| Instruction | Differentiation specification | Value of variable at last execution and current value of variable | Output value |
| :---: | :---: | :---: | :---: |
| LD | Upward differentiation | FALSE at the last execution $\rightarrow$ Currently TRUE | TRUE |
|  |  | Other than the above. | FALSE |
|  | Downward differentiation | TRUE at the last execution $\rightarrow$ Currently FALSE | TRUE |
|  |  | Other than the above. | FALSE |
| LDN | Upward differentiation | FALSE at the last execution $\rightarrow$ Currently TRUE | FALSE |
|  |  | Other than the above. | TRUE |
|  | Downward differentiation | TRUE at the last execution $\rightarrow$ Currently FALSE | FALSE |
|  |  | Other than the above. | TRUE |

The following figure shows a programming example and timing chart.

## Precautions for Correct Use

- An error occurs in the following case and the output value from the last execution is retained.
- You specify an array element for the variable value and the element does not exist.

Example: A BOOL array $a[0 . .5]$ is defined, but the instruction is executed using $\mathrm{a}[10]$ as the variable.

- Do not use these instructions as the rightmost instruction on a rung. If you do, an error occurs on the Sysmac Studio and you cannot transfer the user program to the Controller.

## AND and ANDN

AND: Takes the logical AND of the value of a BOOL variable and the execution condition.
ANDN: Takes the logical AND of the inverse of the value of a BOOL variable and the execution condition.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AND | AND | --- |  | ```result:=vBool1 AND vBOOL2; result:=vBool1 & vBool2;``` |
| ANDN | AND NOT | --- |  | result:=vBool1 AND NOT vBool2; |

## Variables

None

## Function

- AND

The AND instruction takes the logical AND of the value of a specified BOOL variable and the execution condition and outputs it to the next instruction. Use the AND instruction for a NO bit connected in series with the previous instruction.

## - ANDN

The ANDN instruction takes the logical AND of the inverse of the value of a specified BOOL variable and the execution condition and outputs it to the next instruction. Use the ANDN instruction for a NC bit connected in series with the previous instruction.
The following figure shows a programming example of the AND instruction. It takes the logical AND of variable $A$ and variable $B$ and outputs it to variable $C$.

The operation is as shown below if you do not specify upward or downward differentiation.

| Instruction | Combination of variable value and execution <br> condition | Output <br> value <br> ANDVariable value: TRUE <br> Execution condition: TRUE |
| :--- | :--- | :--- |
|  | Other than the above. | TRUE |
| ANDN | Variable value: FALSE <br> Execution condition: TRUE | FALSE |
|  | Other than the above. | FRUE |

If you specify upward or downward differentiation, the operation depends on the following: the value of the variable the last time the instruction was executed, the current value of the variable, and the execution condition. This is shown below.

| Instruction | Differentiation specification | Combination of value of variable at last execution, current value of variable, and execution condition | Output value |
| :---: | :---: | :---: | :---: |
| AND | Upward differentiation | Variable value: FALSE at the last execution $\rightarrow$ Currently TRUE <br> Execution condition: TRUE | TRUE |
|  |  | Other than the above. | FALSE |
|  | Downward differentiation | Variable value: TRUE at the last execution $\rightarrow$ Currently FALSE <br> Execution condition: TRUE | TRUE |
|  |  | Other than the above. | FALSE |
| ANDN | Upward differentiation | Variable value: FALSE at the last execution $\rightarrow$ Currently TRUE <br> Execution condition: TRUE | FALSE |
|  |  | Variable value: Ignored Execution condition: FALSE |  |
|  |  | Other than the above. | TRUE |
|  | Downward differentiation | Variable value: TRUE at the last execution $\rightarrow$ Currently FALSE <br> Execution condition: TRUE | FALSE |
|  |  | Variable value: Ignored Execution condition: FALSE |  |
|  |  | Other than the above. | TRUE |

## Precautions for Correct Use

- An error occurs in the following case and the output value from the last execution is retained.
- You specify an array element for the variable value and the element does not exist.

Example: A BOOL array $a[0 . .5]$ is defined, but the instruction is executed using $a[10]$ as the variable.

- Do not use these instructions as the rightmost instruction on a rung. If you do, an error occurs on the Sysmac Studio and you cannot transfer the user program to the Controller.
- You cannot connect these instructions directly to the bus bar.

## OR and ORN

OR: Takes the logical OR of the value of a BOOL variable and the execution condition.
ORN: Takes the logical OR of the inverse of the value of a BOOL variable and the execution condition.

| Instruction | Name | FB/FUN | Graphic expression |  | ST expression |
| :---: | :---: | :---: | :---: | :---: | :---: |
| OR | OR | --- |  |  | result:=vBool1 OR vBool2; |
| ORN | OR NOT | --- |  |  | result:=vBool1 OR NOT vBool2; |

## Variables

## None

## Function

## - OR

The OR instruction takes the logical OR of the value of a specified BOOL variable and the execution condition and outputs it to the next instruction. Use the OR instruction for a NO bit connected in parallel with the previous instruction. Use the OR instruction to configure a logical OR between an NO bit and one of the following: a LD or LDN instruction connected directly to the bus bar, or the logic block starting with a LD or LDN instruction and ending with the instruction immediately before the OR instruction.

## - ORN

The ORN instruction takes the logical OR of the inverse of the value of a specified BOOL variable and the execution condition and outputs it to the next instruction. Use the ORN instruction for a NC bit connected in parallel with the previous instruction. Use the ORN instruction to configure a logical OR between an NC bit and one of the following: a LD or LDN instruction connected directly to the bus bar, or the logic block starting with a LD or LDN instruction and ending with the instruction immediately before the ORN instruction.
The following figure shows a programming example of the OR instruction. It takes the logical OR of variable $A$ and variable $B$ and outputs it to variable $C$.

The operation is as shown below if you do not specify upward or downward differentiation.

| Instruction | Combination of variable value and execution <br> condition | Output <br> value |
| :--- | :--- | :--- |
| OR | Variable value: FALSE <br> Execution condition: FALSE | FALSE |
|  | Other than the above. | TRUE |
|  | Variable value: TRUE <br> Execution condition: FALSE | FALSE |
|  | Other than the above. | TRUE |

If you specify upward or downward differentiation, the operation depends on the following: the value of the variable the last time the instruction was executed, the current value of the variable, and the execution condition. This is shown below.

| Instruction | Differentiation specification | Combination of value of variable at last execution, current value of variable, and execution condition | Output value |
| :---: | :---: | :---: | :---: |
| OR | Upward differentiation | Variable value: FALSE at the last execution $\rightarrow$ Currently TRUE <br> Execution condition: Ignored. | TRUE |
|  |  | Variable value: Ignored Execution condition: TRUE |  |
|  |  | Other than the above. | FALSE |
|  | Downward differentiation | Variable value: TRUE at the last execution $\rightarrow$ Currently FALSE <br> Execution condition: Ignored. | TRUE |
|  |  | Variable value: Ignored Execution condition: TRUE |  |
|  |  | Other than the above. | FALSE |
| ORN | Upward differentiation | Variable value: FALSE at the last execution $\rightarrow$ Currently TRUE <br> Execution condition: FALSE | FALSE |
|  |  | Other than the above. | TRUE |
|  | Downward differentiation | Variable value: TRUE at the last execution $\rightarrow$ Currently FALSE <br> Execution condition: FALSE | FALSE |
|  |  | Other than the above. | TRUE |

## Precautions for Correct Use

- An error occurs in the following case and the output value from the last execution is retained.
- You specify an array element for the variable value and the element does not exist.

Example: A BOOL array $\mathrm{a}[0 . .5]$ is defined, but the instruction is executed using $\mathrm{a}[10]$ as the variable.

- Do not use these instructions as the rightmost instruction on a rung. If you do, an error occurs on the Sysmac Studio and you cannot transfer the user program to the Controller.

## Out and OutNot

Out: $\quad$ Takes the logical result from the previous instruction and outputs it to a BOOL variable.
OutNot: Takes the inverse of the logical result from the previous instruction and outputs it to a BOOL variable.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Out | Output | --- |  | Variable:=(Logic expression up to previous instruction); |
| OutNot | Output NOT | --- | Variable | Variable:=NOT(Logic expression up to previous instruction); |

## Variables

None

## Function

## - Out

The Out instruction takes the logical result from the previous instruction and outputs it to a specified BOOL variable.
The operation is as shown below if you do not specify upward or downward differentiation.

| Logic processing result <br> from previous instruction | Output |
| :--- | :--- |
| TRUE | TRUE |
| FALSE | FALSE |

You can specify upward or downward differentiation for the Out instruction. If upward or downward differentiation is specified, the output value is determined by changes in the result of logic processing from the previous instruction between the last execution of the instruction and the current execution. The operation is according to the current logical result from the previous instruction, as shown in the following table.

| Differentiation specification | Results of logic processing from the previous <br> execution and current execution | Output |
| :--- | :--- | :--- |
| Upward differentiation | FALSE at the last execution $\rightarrow$ Currently TRUE | TRUE |
|  | Other than the above. | FALSE |
| Downward differentiation | TRUE at the last execution $\rightarrow$ Currently FALSE | TRUE |
|  | Other than the above. | FALSE |

## - OutNot

The OutNot instruction takes the inverse of the logical result from the previous instruction and outputs it to a specified BOOL variable.

| Logic processing result from <br> previous instruction | Output |
| :--- | :--- |
| TRUE | FALSE |
| FALSE | TRUE |

The following figure shows a programming example and timing chart.

## Additional Information

## Differences between the Set and Reset Instructions and the Out and OutNot Instructions

- The Set and Reset instructions operate only when the input value changes to TRUE. They do not operate when the input value is FALSE. When the input value is FALSE, the output does not change.
- The Out and OutNot instructions affect the output whether the logical result of the previous instruction is TRUE or FALSE.

## Precautions for Correct Use

- In the following case, an error occurs and nothing is output.
- You specify an array element for the variable value and the element does not exist.

Example: A BOOL array $a[0 . .5]$ is defined, but the instruction is executed using $a[10]$ as the variable.

- The following connections are possible.
- You can connect another Out instruction after an Out instruction.

- You can connect an LD instruction and Out instruction after an Out instruction.

- The following connections are not possible.
- You cannot connect only an LD instruction after an Out instruction.

- Functions and function blocks cannot be connected after an Out instruction.

- Branches and joins cannot be used after Out instructions.

## ST Statement Instructions

| Instruction | Name | Page |
| :--- | :--- | :--- |
| IF | If | $2-24$ |
| CASE | Case | $2-28$ |
| WHILE | While | $2-32$ |
| REPEAT | Repeat | $2-34$ |
| RETURN | Return | $2-36$ |
| FOR | Repeat Start | $2-37$ |
| EXIT | Break Loop | $2-38$ |

The IF construct uses the evaluation result of a specified condition expression to select one of two statements to execute.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :--- | :--- |
| IF | If |  | None | IF condition expression <br> THEN <br> statement; <br> ELSIF condition expression <br> THEN <br> statement, <br> ELSE <br> statement; <br> END_IF; |
|  |  |  |  |  |

## Variables

None

## Function

The IF construct uses the evaluation result of a specified condition expression to select one of two statements to execute. Use a condition expression that evaluates to TRUE or FALSE.

| Item used for condition <br> expression | Example | $\quad$ Evaluation result |
| :--- | :--- | :--- |
| Logic expression | $\mathrm{a}>3$ | If the value of variable $a$ is greater than 3, the result is TRUE. Oth- <br> erwise, the result is FALSE. |
|  | $\mathrm{a}=\mathrm{b}$ | If the values of variables $a$ and $b$ are equal, the result is TRUE. Oth- <br> erwise, the result is FALSE. |
|  | abc | If the value of variable $a b c$ is TRUE, the result is TRUE. If it is <br> FALSE, the result is FALSE. |
| BOOL constant | TRUE | TRUE |
| Function with a BOOL <br> return value | FUN name | If the function returns TRUE, the result is TRUE. If it returns FALSE, <br> the result is FALSE. |

You can use the following operators in the logic expression.

| Operator | Meaning | Example | Evaluation result |
| :---: | :---: | :---: | :---: |
| = | Equals | $\mathrm{a}=\mathrm{b}$ | If the values of variables $a$ and $b$ are equal, the result is TRUE. Otherwise, the result is FALSE. |
| <> | Not equals | $a<>b$ | If the values of variables $a$ and $b$ are not equal, the result is TRUE. Otherwise, the result is FALSE. |
| < | Comparison | a<b | If the value of variable $a$ is less than the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| <= |  | $\mathrm{a}<=\mathrm{b}$ | If the value of variable $a$ is less than or equal to the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| > |  | a>b | If the value of variable $a$ is greater than the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| >= |  | $\mathrm{a}>=\mathrm{b}$ | If the value of variable $a$ is greater than or equal to the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| AND (\&) | Logical AND | a AND b a \& b | The result is the logical AND of BOOL variables $a$ and $b$. |

| Operator | Meaning | Example | Evaluation result |
| :--- | :--- | :--- | :--- |
| OR | Logical OR | a OR b | The result is the logical OR of BOOL variables $a$ and $b$. |
| XOR | Exclusive OR | a XOR b | The result is the logical exclusive OR of BOOL variables $a$ and <br> $b$. |
| NOT | NOT | NOT a | The result is the NOT of BOOL variable $a$. |

The flowchart in the following example shows the evaluation results for condition expressions 1 and 2. You can use more than one statement for each of statements 1 to 3 .

IF condition expression 1 THEN statement 1;
ELSIF condition expression 2 THEN
statement 2;
ELSE
statement 3;
END_IF;

## Additional Information

- You can use the IF construct to build a hierarchy. The following example executes statement 11 if the evaluation results of both condition expression 1 and condition expression 11 are TRUE.

IF condition expression 1 THEN
IF condition expression 11 THEN statement 11;
ELSIF condition expression 12 THEN statement 12;
ELSE statement 13 ;
END_IF;
ELSIF condition expression 2 THEN statement 2;
ELSE
statement 3;
END_IF;

You can use ELSIF more than once. The following processing flow is for this example.
IF condition expression 1 THEN statement 1;
ELSIF condition expression 2 THEN statement 2;
ELSIF condition expression 3 THEN statement 3;
ELSE
statement 4;
END_IF;

- You do not use ELSIF if there is only one condition expression. You do not use ELSE if no processing is performed when none of the condition expressions are TRUE. The following processing flow is for this example.

IF condition expression THEN
statement,
END_IF;

- There are no restrictions on the statements that you can use. You can use the same types of statements for the statements in the IF construct as you do for the statements outside the IF construct. For example, you can use function block calls and FOR constructs.

## Precautions for Correct Use

- You must always use IF and END_IF. They must be paired.
- You can use a hierarchy that is 15 levels deep, but count all levels of IF, CASE, FOR, WHILE, and REPEAT constructs.

## Sample Programming

This example assigns INT\#0 to variable def if the value of variable $a b c$ is less than INT\#O. It assigns INT\#1 to variable def and INT\#2 to variable ghi if the value of variable abc is INT\#0. It assigns INT\#3 to variable def if the value of variable $a b c$ is none of the above.

| Variable | Data type | Initial value |
| :--- | :--- | :--- |
| abc | INT | 0 |
| def | INT | 0 |
| ghi | INT | 0 |

IF (abc<INT\#0) THEN def:=INT\#O;
ELSIF (abc=INT\#0) THEN def:=INT\#1; ghi:=INT\#2;
ELSE
def:=INT\#3;
END_IF;

## CASE

You use the CASE construct to select the statement to execute based on the value of a specified integer expression.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CASE | Case | --- | None | CASE integer expression OF <br> value: <br> statement, <br> value: <br> statement, <br> ELSE <br> statement, <br> END_CASE; |

## Variables

None

## Function

You use the CASE construct to select the statement to execute based on the value of a specified integer expression.
You can use any of the following as the integer expression and values.

|  | Allowed notation |
| :--- | :--- |
| Integer expression | Integer variable, integer constant, integer expression, or a <br> function that returns an integer return value, enumeration <br> variable, enumeration expression, or enumerator |
| Values | Integer constants |

The flowchart in the following example shows the processing flow for an integer expression. You can use more than one statement for each of the statements.

CASE integer expression OF
1:
statement 1;
2 :
statement $2 ;$
n :
statement $n$;
ELSE
statement m;
END_CASE;

## Additional Information

- You can use the CASE construct to build a hierarchy. The following example executes statement 12 if the value of integer expression 1 is 1 and the value of integer expression 11 is 2.

CASE integer expression 1 OF
1:
CASE integer expression 1 OF
1:
statement 11;
2 :
statement 12;
ELSE
statement 1 m ;
END_CASE;
2 :
statement 2;
3 :
statement 3;
ELSE
statement $m$;
END_CASE;

- You can use more than one value at the same time. Separate values with commas. The following example executes statement 1 if the value of the integer expression is either 1 or 2.
CASE integer expression 1 OF
1,2 :
statement 1;
3 :
statement 2;
4 :
statement 3;
ELSE
statement m;
END_CASE;
- You can use a range of consecutive values. Place two periods between the numbers to indicate consecutive values. The following example executes statement 1 if the value of the integer expression is between 10 and 15 , inclusive.

## CASE integer expression 1 OF

10..15:
statement 1 ;
16:
statement 2;
17:
statement 3;
ELSE statement m;
END_CASE;

- You can omit ELSE. If you do, none of the statements is executed if none of the values is equal to the value of the integer expression.
- There are no restrictions on the statements that you can use. You can use the same types of statements for the statements in the CASE construct as you do for the statements outside the CASE construct. For example, you can use function block calls and FOR constructs.
- The following is different in comparison to a C language switch statement. With a C language switch statement, all statements after a value that equals the integer expression are executed unless a break statement is used. With the CASE statement, only the statements that correspond directly to the value that equals the integer expression are executed. For example, in the following example, statements 1 to 3 are executed for the $C$ language switch statement. Here, only statement 1 is executed for the CASE instruction.

| $C$ Language switch Statement | CASE Instruction |
| :---: | :---: |
| val=1; | val:=1; |
| switch val | CASE val OF |
| case 1: | statement 1; |
| statement 1; | 2 : |
| case 2: | statement 2; |
| statement 2; | 3: |
| case 3: | statement 3; |
| statement 3; | END_CASE; |

## Precautions for Correct Use

- You must always use CASE and END_CASE. They must be paired.
- The data types of the integer expression and values can be different.
- Each value can be given only once.
- You can use a hierarchy that is 15 levels deep, but count all levels of IF, CASE, FOR, WHILE, and REPEAT constructs.

## Sample Programming

This example assigns INT\#10 to variable def if the value of variable $a b c$ is INT\#1, INT\#20 if the value of variable $a b c$ is INT\#2, and INT\#30 if the value of variable abc is INT\#3. Otherwise, it assigns the value of variable ghi to variable def.

| Variable | Data type | Initial value |
| :--- | :--- | :--- |
| abc | INT | 0 |
| def | INT | 0 |
| ghi | INT | 0 |

CASE abc OF
INT\#1: def:=INT\#10;
INT\#2: def:=INT\#20;
INT\#3: def:=INT\#30;
ELSE def:=ghi;
END_CASE;
This example assigns INT\#10 to variable def if the value of variable $a b c$ is INT\#1, INT\#20 if the value of variable $a b c$ is INT\#2 or INT\#5, and INT\#30 if the value of variable $a b c$ is between INT\#6 and INT\#10, inclusive. Otherwise, it does nothing.

| Variable | Data type | Initial value |
| :--- | :--- | :--- |
| abc | INT | 0 |
| def | INT | 0 |

CASE abc OF
INT\#1: def:=INT\#10;
INT\#2,INT\#5: def:=INT\#20;
INT\#6..INT\#10: def:=INT\#30;
END_CASE;

## WHILE

The WHILE construct repeatedly executes a statement as long as the evaluation result of a specified condition expression is TRUE.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :--- | :--- |
| WHILE | While | --- | None | WHILE condition expression <br> DO <br> statement, <br> END_WHILE; |

## Variables

None

## Function

The WHILE construct repeatedly executes a statement as long as the evaluation result of a specified condition expression is TRUE. Use a condition expression that evaluates to TRUE or FALSE.

| Item used for condition <br> expression | Example | Evaluation result |
| :--- | :--- | :--- |
| Logic expression | $\mathrm{a}>3$ | If the value of variable $a$ is greater than 3, the result is TRUE. Oth- <br> erwise, the result is FALSE. |
|  | a=b | If the values of variables a and $b$ are equal, the result is TRUE. Oth- <br> erwise, the result is FALSE. |
|  | abc | If the value of variable abc is TRUE, the result is TRUE. If it is <br> FALSE, the result is FALSE. |
| BOOL constant | TRUE | TRUE |
| Function with a BOOL | FUN name | If the function returns TRUE, the result is TRUE. If it returns FALSE, <br> the result is FALSE. |

You can use the following operators in the logic expression.

| Operator | Meaning | Example | Evaluation result |
| :---: | :---: | :---: | :---: |
| = | Equals | a=b | If the values of variables $a$ and $b$ are equal, the result is TRUE. Otherwise, the result is FALSE. |
| <> | Not equals | a<>b | If the values of variables $a$ and $b$ are not equal, the result is TRUE. Otherwise, the result is FALSE. |
| < | Comparison | a<b | If the value of variable $a$ is less than the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| <= |  | $\mathrm{a}<=\mathrm{b}$ | If the value of variable $a$ is less than or equal to the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| > |  | a>b | If the value of variable $a$ is greater than the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| >= |  | $a>=b$ | If the value of variable $a$ is greater than or equal to the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| AND (\&) | Logical AND | $\begin{aligned} & \text { a AND b } \\ & \text { a \& b } \end{aligned}$ | The result is the logical AND of BOOL variables $a$ and $b$. |
| OR | Logical OR | a OR b | The result is the logical OR of BOOL variables $a$ and $b$. |
| XOR | Exclusive OR | a XOR b | The result is the logical exclusive OR of BOOL variables $a$ and b. |
| NOT | NOT | NOT a | The result is the NOT of BOOL variable a. |

The following processing flow is for this example. You can use more than one statement.
WHILE condition expression DO statement,
END_WHILE;

## Additional Information

- The statement is not executed even once if the condition expression is FALSE the first time it is evaluated.
- There are no restrictions on the statements that you can use. You can use the same types of statements for the statements in the WHILE construct as you do for the statements outside the WHILE construct. For example, you can use function block calls and FOR constructs.

## Precautions for Correct Use

- You must always use WHILE and END_WHILE. They must be paired.
- You can use a hierarchy that is 15 levels deep, but count all levels of IF, CASE, FOR, WHILE, and REPEAT constructs.

## Sample Programming

This example adds INT\#7 to variable abc as long as the value of variable abc is less than or equal to INT\#1000.

| Variable | Data type | Initial value |
| :--- | :--- | :--- |
| abc | INT | 0 |

## abc:=INT\#0;

WHILE $a b c<=$ INT\#1000 DO abc:=abc+INT\#7;
END_WHILE;

## REPEAT

The REPEAT construct executes a statement once and then executes it repeatedly until a specified condition expression is TRUE.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :--- | :--- | :--- | :--- |
| REPEAT | Repeat | --- | None | REPEAT <br> statement, <br> UNTIL condition expression <br> END_REPEAT; |

## Variables

None

## Function

The REPEAT construct executes a statement once and then executes it repeatedly until a specified condition expression is TRUE. Use a condition expression that evaluates to TRUE or FALSE.

| Item used for condition <br> expression | Example | $\quad$ Evaluation result |
| :--- | :--- | :--- |
| Logic expression | $\mathrm{a}>3$ | If the value of variable $a$ is greater than 3, the result is TRUE. Oth- <br> erwise, the result is FALSE. |
|  | $\mathrm{a}=\mathrm{b}$ | If the values of variables $a$ and $b$ are equal, the result is TRUE. Oth- <br> erwise, the result is FALSE. |
| BOOL variable | abc | If the value of variable $a b c$ is TRUE, the result is TRUE. If it is <br> FALSE, the result is FALSE. |
| BOOL constant | TRUE | TRUE |
| Function with a BOOL | FUN name | If the function returns TRUE, the result is TRUE. If it returns FALSE, <br> the result is FALSE. |

You can use the following operators in the logic expression.

| Operator | Meaning | Example | Evaluation result |
| :---: | :---: | :---: | :---: |
| = | Equals | a=b | If the values of variables $a$ and $b$ are equal, the result is TRUE. Otherwise, the result is FALSE. |
| <> | Not equals | a<>b | If the values of variables $a$ and $b$ are not equal, the result is TRUE. Otherwise, the result is FALSE. |
| < | Comparison | a<b | If the value of variable $a$ is less than the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| <= |  | $a<=b$ | If the value of variable $a$ is less than or equal to the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| > |  | a>b | If the value of variable $a$ is greater than the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| >= |  | $a>=b$ | If the value of variable $a$ is greater than or equal to the value of variable $b$, the result is TRUE. Otherwise, the result is FALSE. |
| AND (\&) | Logical AND | a AND b $a \& b$ | The result is the logical AND of BOOL variables $a$ and $b$. |
| OR | Logical OR | a OR b | The result is the logical OR of BOOL variables $a$ and $b$. |
| XOR | Exclusive OR | a XOR b | The result is the logical exclusive OR of BOOL variables $a$ and b. |
| NOT | NOT | NOT a | The result is the NOT of BOOL variable $a$. |

The following processing flow is for this example. You can use more than one statement.
REPEAT
statement;
UNTIL condition expression
END_REPEAT;

## Additional Information

- The statement is executed once before the condition expression is evaluated. Therefore, the statement is always executed at least once.
- There are no restrictions on the statements that you can use. You can use the same types of statements for the statements in the REPEAT construct as you do for the statements outside the REPEAT construct. For example, you can use function block calls and FOR constructs.

## Precautions for Correct Use

- You must always use REPEAT, UNTIL, and END_REPEAT. They must be used as a set.
- You can use a hierarchy that is 15 levels deep, but count all levels of IF, CASE, FOR, WHILE, and REPEAT constructs.

## Sample Programming

This example adds INT\#1 to variable abc until the value of variable abc exceeds INT\#10.

| Variable | Data type | Initial value |
| :--- | :--- | :--- |
| abc | INT | 0 |

```
abc:=INT#0;
REPEAT
abc:=abc+INT\#1;
UNTIL abc>INT\#10
```

END_REPEAT;

## RETURN

Refer to RETURN on page 2-61 in the Sequence Control Instructions for a description of this instruction.

## FOR

Refer to FOR and NEXT on page 2-76 in the Sequence Control Instructions for a description of this instruction.

## EXIT

Refer to BREAK on page 2-81 in the Sequence Control Instructions for a description of this instruction. The BREAK ladder diagram instruction and the EXIT structured text instruction function in the same way.

## Sequence Input Instructions

| Instruction | Name | Page |
| :---: | :--- | :---: |
| R_TRIG (Up) and F_TRIG (Down) | Up Trigger/ <br> Down Trigger | $2-40$ |
| TestABit and TestABitN | Test A Bit/ <br> Test A Bit NOT | $2-43$ |

## R_TRIG (Up) and F_TRIG (Down)

R_TRIG (Up): Outputs TRUE for one task period only when the input signal changes to TRUE.
F_TRIG (Down): Outputs TRUE for one task period only when the input signal changes to FALSE.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| R_TRIG | Up Trigger | FB |  | R_TRIG_instance(Clk, Q); |
| Up |  | FUN | $-\ln \quad \text { Up } \quad \text { Out }$ | None |
| F_TRIG | Down Trigger | FB | $\begin{gathered} \text { F_TRIG_instance } \\ - \text { F_TRIG }^{\text {Clk }} \quad \end{gathered}$ | F_TRIG_instance(Clk, Q); |
| Down |  | FUN | $-\ln$ Down Out | None |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Clk, In | Input signal | Input | Input signal | Depends on data type. | --- | --- |
| Q, Out | Output signal | Output | Output signal | Depends on data type. | --- | --- |

## Function

## - R_TRIG

R_TRIG assigns TRUE to output signal $Q$ for one task period only when input signal Clk changes to TRUE. Otherwise, the value of $Q$ is FALSE. In the first task period in which this instruction is executed, the value of $Q$ is FALSE regardless of the value of Clk. If the value of Clk is TRUE when the power supply is turned ON, the value of $Q$ remains FALSE until the value of Clk changes to FALSE and then back to TRUE.

## - Up

The functions of the R_TRIG instruction and the Up instruction are exactly the same. The Clk variable of the R_TRIG instruction corresponds to the In variable of the Up instruction. The $Q$ variable corresponds to the Out variable.

The following figure shows a programming example and timing chart.

## - F_TRIG

F_TRIG assigns TRUE to output signal $Q$ for one task period only when input signal $C l k$ changes to FALSE. Otherwise, the value of $Q$ is FALSE. In the first task period in which this instruction is executed, the value of $Q$ is FALSE regardless of the value of $C / k$. If the value of $C / k$ is FALSE when the power supply is turned ON, the value of $Q$ remains FALSE until the value of C/k changes to TRUE and then back to FALSE.

## - Down

The functions of the F_TRIG instruction and the Down instruction are exactly the same. The Clk variable of the F_TRIG instruction corresponds to the In variable of the Down instruction. The $Q$ variable corresponds to the Out variable.
The following figure shows a programming example and timing chart.

## Precautions for Correct Use

- Detection of upward or downward differentiation depends on differences between the current value of Clk or In and the value the last time the instruction was executed. Caution is required when using the JMP instruction or other times that the instruction is not executed every task period.
- If power is interrupted, the value of Clk or In is not detected as FALSE. The value of Clk or In is detected as FALSE only if the instruction evaluates the value of Clk or In while Clk or In is FALSE.

## TestABit and TestABitN

TestABit：Outputs the value of the specified bit in a bit string．
TestABitN：Outputs the inverse of the value of the specified bit in a bit string．

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Bit string | Input | Bit string | Depends on data type． | －－－ | ＊ |
| Pos | Bit position |  | Specified bit position | 0 to No．of bits in In－1 |  | 0 |
| Out | Bit value | Output | TestABit <br> Value of specified bit <br> TestABitN <br> Inverse of value of specified bit | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\underset{\substack{\text { D } \\ \hline \\ \hline}}{ }$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\underset{\underset{J}{\mathrm{C}}}{\substack{C}}$ | $\underset{\substack{C}}{\substack{ \\\hline}}$ | $\underset{\underset{Z}{\mathrm{C}}}{\substack{\text { O}}}$ | $\underset{\underset{i}{c}}{\stackrel{\rightharpoonup}{2}}$ | $\underset{\sim}{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{2}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \pi \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 置 } \end{aligned}$ | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 另 } \\ & \text { 翤 } \end{aligned}$ | 음 | 먹 | O 示 n |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Pos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

## - TestABit

The TestABit instruction assigns the value of the bit at bit position Pos in the bit string $I n$ to the bit value Out when EN is TRUE. When EN is FALSE, the value of Out is FALSE.

## - TestABitN

The TestABitN instruction assigns the inverse of the value of the bit at bit position Pos in the bit string In to the bit value Out when EN is TRUE.
When EN is FALSE, the value of Out is FALSE.
The following example shows the TestABit instruction when Pos is USINT\#3.

LD
 ST
def:=TestABit(abc, USINT\#3);

Out=def
TRUE

## Precautions for Correct Use

- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.
- An error occurs in the following case. Out will be FALSE.
- The value of Pos is greater than No. of bits in $\ln -1$.

## Sequence Output Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| RS | Reset-Priority Keep | $2-46$ |
| SR | Set-Priority Keep | $2-48$ |
| Set and Reset | Set/Reset | $2-50$ |
| SetBits and ResetBits | Set Bits/Reset Bits | $2-53$ |
| SetABit and ResetABit | Set A Bit/Reset A Bit | $2-55$ |
| OutABit | Output A Bit | $2-57$ |

RS

The RS instruction retains the value of a BOOL variable. It gives priority to the Reset input if both the Set input and Reset input are TRUE.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| RS | Reset-Priority Keep | FB |  | RS_instance(Set, Reset1, Q1); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Set | Set | Input | Set input | Depends on data type. | -- |  |
|  | Reset input |  | 0 |  |  |  |
| Reset1 | Reset |  | Output | Keep output | Depends on data type. | --- |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times, durations, dates, and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 感 | $\begin{aligned} & \text { D } \\ & \text { In } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 믕 0 D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\underset{\sum_{1}}{\substack{c}}$ | $\underset{\substack{C}}{\substack{\text { n }}}$ | $\frac{\text { 들 }}{\sum_{1}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\sum_{-1}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\sim}{\text { 민 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{m}{2} \end{aligned}$ | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 밀 } \\ & \hline 1 \end{aligned}$ | O-1 | 먹 | 第 |
| Set | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Reset1 | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Q1 | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The RS instruction forms a self-holding output that gives priority to resetting. The following table shows the relationship between the inputs are outputs.

| Value of Set | Value of Reset1 | Value of Q1 |
| :--- | :--- | :--- |
| TRUE | TRUE | FALSE |
| TRUE | FALSE | TRUE |
| FALSE | TRUE | FALSE |
| FALSE | FALSE | Not changed. |

The following figure shows a programming example and timing chart.

## Additional Information

- The RS instruction behaves like the following self-holding rung.

- However, if the RS instruction is in a master control region and the master control region is reset, the behavior will not be the same as the above self-holding rung.

| Instruction/rung | Value of $\boldsymbol{B}$ | Value of $\boldsymbol{a b c}$ |
| :--- | :--- | :--- |
| RS instruction | TRUE | Not changed. |
|  | FALSE | FALSE |
| Self-holding rung | TRUE | FALSE |
|  | FALSE |  |

## Precautions for Correct Use

- Never use an NC bit directly from an external device for the Reset1 input. The internal power supply in the Controller will not turn OFF immediately when the AC power is interrupted (even for momentary interruptions), and the input from the Input Unit may change to ON first. This could cause the Reset1 input to change to TRUE.
- If this instruction is used in a ladder diagram, the value of $Q 1$ is retained if an error occurs in the previous instruction on the rung.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), Q1 retains the value from the last execution.
- If this instruction is in a master control region and the master control region is reset, the operation is as follows:
- If the value of Reset1 is TRUE, the value of Q1 is retained. If the value of Reset1 is FALSE, the value of Q1 changes to FALSE.
- FALSE is input to the instruction that is connected to $Q 1$ even if the value of $Q 1$ is TRUE.

## SR

The SR instruction retains the value of a BOOL variable．It gives priority to the Set input if both the Set input and Reset input are TRUE．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SR | Set－Priority Keep | FB | SR＿instance | SR＿instance（Set1，Reset， |
|  |  |  | Set1 SR <br> Reset Q1 |  |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Set1 | Set | Input | Set input | Depends on data type． | －－－ | 0 |
| Reset | Reset |  | Reset input |  |  |  |
| Q1 | Keep | Output | Keep output | Depends on data type． | －－－ | －－－ |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  | $$ |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 罥 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { D } \\ & \text { In } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{1} \\ & 0 \end{aligned}$ |  | $\underset{\substack{C}}{\substack{c}}$ | $\frac{\text { 들 }}{\sum_{1}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{E}}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | $\sum_{-1}^{0}$ | $\bar{K}_{-1}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \frac{-1}{3} \\ & \frac{1}{n} \end{aligned}$ | $\begin{aligned} & \text { 友 } \\ & \cdots \end{aligned}$ | 음 | 먹 | 号 |
| Set1 | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Reset | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Q1 | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The SR instruction forms a self－holding output that gives priority to setting．The following table shows the relationship between the inputs are outputs．

| Value of Set1 | Value of Reset | Value of Q1 |
| :--- | :--- | :--- |
| TRUE | TRUE | TRUE |
| TRUE | FALSE | TRUE |
| FALSE | TRUE | FALSE |
| FALSE | FALSE | Not changed． |

The following figure shows a programming example and timing chart.

## Additional Information

- The SR instruction behaves like the following self-holding rung.

- However, if the SR instruction is in a master control region and the master control region is reset, the behavior will not be the same as the above self-holding rung.

| Instruction/rung | Value of $\boldsymbol{B}$ | Value of $\boldsymbol{a b c}$ |
| :--- | :--- | :--- |
| SR instruction | TRUE | Not changed. |
|  | FALSE | FALSE |
|  | TRUE | FALSE |
|  | FALSE |  |

## Precautions for Correct Use

- Never use an NC bit directly from an external device for the Reset input. The internal power supply in the Controller will not turn OFF immediately when the AC power is interrupted (even for momentary interruptions), and the input from the Input Unit may change to ON first. This could cause the Reset input to change to TRUE.
- If this instruction is used in a ladder diagram, the value of Q1 is retained if an error occurs in the previous instruction on the rung.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), Q1 retains the value from the last execution.
- If this instruction is in a master control region and the master control region is reset, the operation is as follows:
- If the value of Reset is TRUE, the value of $Q 1$ is retained. If the value of Reset is FALSE, the value of Q1 changes to FALSE.
- FALSE is input to the instruction that is connected to Q1 even if the value of Q1 is TRUE.

## Set and Reset

Set: Changes a BOOL variable to TRUE.
Reset: Changes a BOOL variable to FALSE.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Set | Set | --- |  | None |
| Reset | Reset | --- |  | None |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Out | Output | Output | Output | Depends on data type. | --- | --- |

## Function

## - Set

The Set instruction changes Out to TRUE if the input is TRUE. If Out is TRUE, the Set instruction will not change it to FALSE even if the input changes to FALSE. Use the Reset instruction to change Out to FALSE.

- Reset

The Reset instruction changes Out to FALSE if the input is TRUE. If Out is FALSE, the Reset instruction will not change it to TRUE even if the input changes to FALSE. Use the Set instruction to change Out to TRUE.
The operation is as shown below if you do not specify upward or downward differentiation.

| Instruction | Input | Output value |
| :--- | :--- | :--- |
| Set | TRUE | TRUE |
|  | FALSE | Not changed. |
| Reset | TRUE | FALSE |
|  | FALSE | Not changed. |

If you specify upward or downward differentiation, the operation depends on the following: the value of the input for the last execution and the current value of the input. This is shown below.

| Instruction | Differentiation specification | Value of input at last execution and current value | Output value |
| :---: | :---: | :---: | :---: |
| Set | Upward differentiation | FALSE at the last execution $\rightarrow$ Currently TRUE | TRUE |
|  |  | Other than the above. | Not changed. |
|  | Downward differentiation | TRUE at the last execution $\rightarrow$ Currently FALSE | TRUE |
|  |  | Other than the above. | Not changed. |
| Reset | Upward differentiation | FALSE at the last execution $\rightarrow$ Currently TRUE | FALSE |
|  |  | Other than the above. | Not changed. |
|  | Downward differentiation | TRUE at the last execution $\rightarrow$ Currently FALSE | FALSE |
|  |  | Other than the above. | Not changed. |

The following figure shows a programming example and timing chart.

LD

LD

## Additional Information

## Differences between the Set and Reset Instructions and the Out Instruction

- The Set and Reset instructions operate only when the input value changes to TRUE. They do not operate when the input value is FALSE. When the input value is FALSE, the output does not change.
- The Out instruction changes the specified variable to TRUE when the result from the previous instruction is TRUE and to FALSE when the result from the previous instruction is FALSE. It operates both when the input is TRUE and when it is FALSE.

## Differences between the Set and Reset Instructions and the SR and RS Instructions

- The SR and RS instructions require that the Set input and Reset input are in the same place in the program. You can place the Set and Reset instructions in different places.

## Precautions for Correct Use

- If this instruction is in a master control region and the master control region is reset, the value of Out is retained.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of Out is retained.
- These instructions will not change the value of Out if you specify upward differentiation and the input is TRUE immediately after the power turns ON. The input must first change to FALSE and then to TRUE before the value of Out changes.
- These instructions will change the value of Out if you do not specify upward differentiation and the input is TRUE immediately after the power turns ON. In this case it is not necessary for the input to change to FALSE first.

## SetBits and ResetBits

SetBits：Changes consecutive bits in bit string data to TRUE．
ResetBits：Changes consecutive bits in bit string data to FALSE．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SetBits | Set Bits | FUN |  | SetBits（InOut，Pos，Size）； |
| ResetBits | Reset Bits | FUN |  | ResetBits（InOut，Pos，Size）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| InOut | Bit string | In－out | Bit string | Depends on data type． | －－－ | －－－ |
| Pos | Bit position | Input | Specified bit position | 0 to No．of bits in InOut $-1$ | －－－ | 0 |
| Size | Number of bits |  | Number of bits | 0 to No．of bits in InOut |  | 1 |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

|  | ロ <br> 0 <br> $\frac{0}{\square}$ <br> $\stackrel{0}{3}$ |  | Bit st | rings |  |  |  |  | Inte |  |  |  |  |  |  |  | me | dur | ion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| InOut |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Pos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

## －SetBits

The SetBits instruction changes the value of Size bits from the bit position Pos in the bit string InOut to TRUE．The status of the other bits will not change．

## - ResetBits

The ResetBits instruction changes the value of Size bits from the bit position Pos in the bit string InOut to FALSE. The status of the other bits will not change.
The following example shows the SetBits instruction when Pos is USINT\#3 and Size is USINT\#2.

## Additional Information

Use these instructions to globally set variables with AT specification in memory areas that handle data by word (e.g., the DM Area) to TRUE or FALSE.

## Precautions for Correct Use

- If this instruction is in a master control region and the master control region is reset, the value of InOut is retained.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of InOut is retained.
- The value of InOut does not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and Out and InOut will not change.
- The value of Pos is greater than No. of bits in InOut - 1 .
- The value of Size is outside of the valid range.
- The value of Pos or Size exceeds the number of bits in InOut.

## SetABit and ResetABit

SetABit：Changes the specified bit in bit string data to TRUE．
ResetABit：Changes the specified bit in bit string data to FALSE．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SetABit | Set A Bit | FUN |  | SetABit（InOut，Pos）； |
| ResetABit | Reset A Bit | FUN |  | ResetABit（InOut，Pos）； |

Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| InOut | Bit string | In－out | Bit string | Depends on data type． | --- | --- |
| Pos | Bit position | Input | Specified bit position | 0 to No．of bits in InOut <br> -1 | --- | 0 |
| Out | Return <br> value | Output | Always TRUE | TRUE only | --- | --- |

|  | $\begin{aligned} & \text { © } \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ |  | Bit st | rings |  |  |  |  | Inte |  |  |  |  |  |  |  |  |  | tior |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ⿴囗十 <br> 0 | $\begin{aligned} & \text { ロ } \\ & \underset{m}{1} \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\sum_{0}^{C}$ D | $\underset{\underset{1}{\infty}}{\stackrel{C}{\infty}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{0_{2}^{C}}{\sum_{1}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\underset{-1}{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\sum_{-1}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $$ | $\stackrel{-1}{3}$ | 号 | －1 | 먹 | 号 |
| InOut |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Pos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

## －SetABit

The SetABit instruction changes the value of the bit at bit position Pos in the bit string InOut to TRUE．

The bits that are not specified do not change．
Even if EN changes to FALSE after execution，the Pos bit in InOut will not change．

## - ResetABit

The ResetABit instruction changes the value of the bit at bit position Pos in the bit string InOut to FALSE.

The bits that are not specified do not change.
Even if EN changes to FALSE after execution, the Pos bit in InOut will not change.
The following example shows the SetABit instruction when Pos is USINT\#3.

## Additional Information

## Differences between the SetABit and ResetABit Instructions and the OutABit Instruction

- The SetABit and ResetABit instructions change the value of the specified bit to either TRUE or FALSE.
- With the OutABit instruction, however, you can dynamically change the value to which the specified bit is set.

## Precautions for Correct Use

- If this instruction is in a master control region and the master control region is reset, the value of InOut is retained.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of InOut is retained.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE, and Out and InOut will not change.
- The value of Pos is greater than No. of bits in $\operatorname{In}-1$.

## OutABit

The OutABit instruction changes the specified bit in bit string data to TRUE or FALSE．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| OutABit | Output A Bit | FUN |  | OutABit（InOut，Pos，BitVal）； |

Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| InOut | Bit string | In－out | Bit string | Depends on data type． | －－－ | －－－ |
| Pos | Bit position | Input | Specified bit position | 0 to No．of bits in InOut － 1 | －－－ | 0 |
| BitVal | Set value |  | Value to set | Depends on data type． |  | TRUE |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

|  |  |  | Bit st | rings |  |  |  |  | Inte |  |  |  |  |  |  |  | me | dur | ion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 置 } \end{aligned}$ | $\begin{aligned} & \text { 圌 } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { D } \end{aligned}$ | 믈 0 0 0 | $\sum_{\substack{\Gamma}}^{\sum_{0}}$ | ${\underset{Z}{\mathrm{~S}}}_{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{\text { 들 }}{\frac{1}{1}}$ | $\stackrel{C}{\underset{\lambda}{\mathbf{C}}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 믄 }}{ }$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { ग } \\ & \boldsymbol{m} \\ & \stackrel{N}{2} \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \hline \end{aligned}$ | $\frac{-1}{1}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 음 | 먹 | 号 |
| InOut |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Pos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| BitVal | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The OutABit instruction stores the value of set value BitVal at bit position Pos in the bit string InOut. Only the bit at Pos changes.
The following example is for when Pos is USINT\#2 and BitVal is TRUE.
LD ST

## Additional Information

## Differences between the SetABit and ResetABit Instructions and the OutABit Instruction

- The SetABit and ResetABit instructions change the value of the specified bit to either TRUE or FALSE.
- With the OutABit instruction, however, you can dynamically change the value to which the specified bit is set if you change the value of BitVal.

## Precautions for Correct Use

- If this instruction is in a master control region and the master control region is reset, the value of InOut is retained.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of InOut is retained.
- Return value Out is not used when the instruction is used in ST.
- An error will occur in the following case. ENO will be FALSE, and Out and InOut will not change.
- The value of Pos is greater than No. of bits in InOut-1.

## Sequence Control Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| End | End | $2-60$ |
| RETURN | Return | $2-61$ |
| MC and MCR | Master Control Start/ <br> Master Control End | $2-62$ |
| JMP | Jump | $2-74$ |
| FOR and NEXT | Repeat Start/ <br> Repeat End | $2-76$ |
| BREAK | Break Loop | $2-81$ |

## End

The End instruction ends execution of a program in the current task period.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :---: | :---: |
| End | End | FUN | $\boxed{\text { End }}$ | None |
|  |  |  | -EN ENO |  |

## Variables

None

## Function

The End instruction ends execution of a program in the current task period.
The following figure shows a programming example. When the End instruction is executed in the example, the SR instruction that follows it is not executed.

## Precautions for Correct Use

- This instruction must be used only in a program.
- If this instruction is used in a function, function block, or inline ST, a building error will occur.
- You must connect this instruction to the left bus bar.

## RETURN

The RETURN instruction ends a function or function block and returns processing to the calling instruction.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :---: | :---: |
| RETURN | Return | FUN | RETURN; |  |
|  |  |  | RETURN | ENO |
|  |  |  |  |  |

## Variables

None

## Function

The RETURN instruction ends a function or function block and returns processing to the calling instruction.
The following figure shows a programming example. When the RETURN instruction is executed in the example, the SR instruction that follows it is not executed.

ST

RETURN;
SR_instance(A, B, abc);

## Precautions for Correct Use

- Observe the following precautions if you use this instruction in a ladder diagram.
- Use this instruction only in functions and function blocks. If you use it in a program, a building error will occur.
- Always connect this instruction directly to the left bus bar.
- Before you execute this instruction set the return values, output variables, and ENO value of the POU.
- If you use this instruction too often, the flow of processing will be difficult to understand. Use it with caution.

## MC and MCR

MC: Marks the starting point of a master control region and resets the master control region.
MCR: Marks the end point of a master control region.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MC | Master Control Start | --- | $$ | None |
| MCR | Master Control End | --- | EN MCR $=-\mathrm{MCNo}$ -1 | None |

## Variables

## Function

Master control is used to stop processing or place in an equivalent status all POUs in a specified region of a program. You can use master control to easily control the execution conditions for a relatively long segment of processing.
The region in the program for which master control is applied is called the master control region. You place the MC instruction at the start of the master control region and the MCR instruction at the end. When the value of the master control input In changes to FALSE, the outputs for all LD instructions that are connected to the left bus bar in the master control region are forced to change to FALSE. This is called a master control reset.
When master control is reset, the POUs that follow the LD instructions, as a rule, operate as if the execution condition is FALSE. There are, however, some POUs that operate differently. This is explained later.

If the value of $I n$ is TRUE, then master control is not reset. The POUs in the master control region operate normally.

## POU Operation during a Master Control Reset

The operation of the POUs when master control is reset depends on the POU as described in the following table.

| POU | Operation |
| :--- | :--- |
| Out and OutABit instructions | FALSE is output to the specified variable. |
| OutNot instruction | FALSE is output to the specified variable. |
| Set and Reset instructions | The output from before the master control reset is retained. |
| TON instruction | The instruction operates with a FALSE value for timer input In. That <br> means that the timer is reset. The value of elapsed time $E T$ changes to 0 <br> and the value of timer output $Q$ changes to FALSE. |
| TOF instruction | The instruction operates with a TRUE value for timer input In. That means <br> that the timer is reset. The value of elapsed time $E T$ changes to 0 and the <br> value of timer output $Q$ changes to TRUE. However, if an Out instruction <br> is connected to $Q$, the execution condition to the Out instruction is <br> FALSE. |
| TP instruction | The instruction operates with a FALSE value for timer input In. That <br> means that the timer is reset. <br> Timing active: $\quad$ The value of elapsed time $E T$ is incremented to the <br> end and then returns to 0. The value of timer output <br> $Q$ is TRUE until the end of timing, and then it <br> changes to FALSE. |
| The value of $E T$ changes to 0 and the value of $Q$ |  |
| changes to FALSE. |  |

| POU | Operation |
| :--- | :--- |
| BREAK instruction | This instruction is not executed. |
| Function blocks that are executed | The power flow from the left bus bar changes to FALSE. If the instruction <br> over more than one task period (i.e., <br> instructions with Done, Busy, and <br> Error output variables) <br> is continued until processing is completed. Busy, Done, and Error outputs <br> will be made, but FALSE will always be output if the next instruction is an <br> output instruction. If a variable is directly connected to Busy, Done, or <br> Error, the proper value for the instruction specifications will be assigned to <br> that variable. You can also get the value of Busy, Done, or Error in the <br> form instance_name.output_variable. |
| Other functions | These are not executed. |
| Other function blocks | The power flow from the left bus bar changes to FALSE. |

The operation of some typical instructions is described below.

## - Out

FALSE is output while the master control is reset.

## - OutNot

FALSE is output while the master control is reset. Caution is required because this operation of the OutNot instruction is different from when the output of the previous LD instruction is FALSE.

## - Set and Reset

The previous value of the output is retained while the master control is reset.

## - CTU, CTD, and CTUD

The previous counter value is retained while the master control is reset. When the master control reset is cleared, counting continues from the counter value that was retained.

## Operation of POUs with Input Upward Differentiation or Input Downward Differentiation

The POUs that are given in the following table have upward or downward differentiation specifications.

| Differentiation | Instructions |
| :--- | :--- |
| Input upward differentiation | - LD, LDN, AND, ANDN, OR, ORN, and OUT with upward differentiation spec- |
|  | ifications |
|  | - R_TRIG (Up) |
|  | -Functions with an @ input upward differentiation option <br>  <br>  <br>  <br> - Functions blocks (e.g., counter instructions) with input upward differentiation <br> specifications |
| Input downward differentiation | - LD, LDN, AND, ANDN, OR, ORN, and OUT with downward differentiation |
|  | - specifications |
|  | - F_TRIG (Down) |
|  | - Functions with a \% input downward differentiation option |

When the master control is reset or the reset is cleared, the execution conditions for these POUs change. That means that the upward or downward differentiation conditions for these POUs may be met. If the upward or downward differentiation conditions are met, then the instructions are executed accordingly. The operation of some typical instructions is described below.

## - R_TRIG (Up)

When the master control is reset, the execution condition changes to FALSE. If the execution condition is TRUE when the master control reset is cleared, the input upward differentiation condition is met and the instruction operates accordingly.

## - F_TRIG (Down)

When the master control is reset, the execution condition changes to FALSE. If the previous execution condition was TRUE, then the input downward differentiation condition is met. However, the value of the output from the F_TRIG (Down) instruction during the master control reset is forced to change to FALSE, so the output value changes to FALSE.

## - Set and Reset with Input Upward Differentiation Specification

The previous value of the output is retained while the master control is reset. When the master control reset is cleared, the execution condition changes to TRUE and the instruction operates.

Here, the input upward differentiation condition is met and the output value changes to TRUE.

Here, the input upward differentiation condition is met and the output value changes to FALSE.

## - Set and Reset with Input Downward Differentiation Specification

When the master control is reset, the execution condition changes to FALSE. If the previous execution condition was TRUE, then the input downward differentiation condition is met. However, during the master control reset, the previous output value is retained, so as a result the value of the output is retained.

The input downward differentiation condition is met, but master control is reset, so the output is retained.

## - CTU, CTD, and CTUD

When the master control is reset, the value of the counter input changes to FALSE. If the value of the counter input is TRUE when the master control reset is cleared, the input upward differentiation condition is met and the instruction counts.

Input upward differentiation condition met.
Always use the MC and MCR instructions as a pair in the same POU. The same value is used for master control number MCNo for both of the paired MC and MCR instructions. The user does not set the value of MCNo. It is automatically registered by the Sysmac Studio.

The MC and MCR instructions can be nested to up to 15 levels.

The following figure shows a programming example.
If the value of bit $A$ is FALSE, the master control region is reset. While the master control region is in a reset state, the TON and MOVE instructions are not executed. Also the Out instruction and OutNot instruction will output FALSE to bits D and E.

## Precautions for Correct Use

- These instructions must be used in a ladder diagram. They cannot be used in ST. They also cannot be used in inline ST in a ladder diagram.
- Always use the MC and MCR instructions as a pair in the same POU.
- Always place the MCR instruction after the MC instruction.
- Do not nest the MC and MCR instructions to more than 15 levels.
- If there is inline ST in the master control region, the inline ST is not executed when the master control region is reset.
- If you use the MC and MCR instructions and the JMP instruction together, the operation is as follows:
- The following figure shows an MC-MCR pair inside a JMP-Label pair. Here, the jump is executed regardless of the value of $I n$.

- The following figure shows a JMP-Label pair inside an MC-MCR pair. Here, operation is as given in the following table.

| Value of In | Operation |
| :---: | :---: |
| TRUE | Master control region is not reset. The jump is made. |
| FALSE | Master control region is reset. The jump is not made. |

- The instructions are in the following order in the following figure: JMP instruction, MC instruction, Label, and MCR instruction. First, the jump is made. As a result, the MC instruction is not executed. Therefore, the instructions after the Label instruction are executed. If the value of $I n$ is FALSE, the MCR instruction is executed, but nothing changes.

- The instructions are in the following order in the following figure: MC instruction, JMP instruction, MCR instruction, and Label. Here, operation is as given in the following table.

| Value of $\boldsymbol{I n}$ | Operation |
| :--- | :--- |
| TRUE | Master control region is not reset. The jump is made. |
| FALSE | Master control region is reset. The jump is not made. |
| $\quad$ In = TRUE $\quad$ In FALSE |  |

- If you use the MC and MCR instructions and the FOR and NEXT instructions together, the operation is as follows:
- The following figure shows an MC-MCR pair inside a FOR-NEXT pair. Here, operation is as given in the following table.

| Value of $\boldsymbol{I n}$ | Operation |
| :--- | :--- |
| TRUE | Master control region is not reset. The FOR loop is executed. |
| FALSE | Master control region is reset. The FOR loop is executed, but the <br> instructions between the MC and MCR instructions are not exe- <br> cuted. |

- The following figure shows a FOR-NEXT pair inside an MC-MCR pair. Here, operation is as given in the following table.

- A building error occurs if the FOR, NEXT, MC, and MCR instructions are used in either of the following orders.

FOR, MC, NEXT, MCR, or MC, FOR, MCR, NEXT

## JMP

The JMP instruction moves processing to the specified jump destination.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :---: | :--- |
| JMP | Jump | FUN | $\longrightarrow$ Label | None |

## Variables

None

## Function

When the execution condition is TRUE, the JMP instruction moves processing to the jump destination specified by a Label in a ladder diagram. The label can be any text string.
The following figure shows a programming example. This example uses the text string STEP1 as the label. When the JMP instruction is executed, processing moves to the location marked STEP1. In this example, the Out instruction between the JMP instruction and the Label is not executed, and the value of variable $B$ is retained.

LD

## Additional Information

- You can also jump to a Label instruction above the JMP instruction in the section.
- You can use the same Label instruction as the jump destination for more than one JMP instruction.

## Precautions for Correct Use

- You cannot omit labels. If you omit a label, a building error will occur.
- Place the JMP and Label instructions in the same POU and in the same section.
- Do not set the same Label instruction more than once in the same section.
- You cannot jump into a FOR-NEXT loop from outside the loop.
- The following restrictions apply to the characters that can be used as labels.

| Item | Specification |
| :---: | :---: |
| Maximum number of bytes | 127 bytes <br> 127 characters when converted to ACSII <br> 31 characters when converted to Japanese characters (including single-byte kana) |
| Character code | UTF-8 |
| Applicable characters | Not case sensitive. <br> English alphanumeric characters and other language characters. <br> Symbols: _ (underbar) and ~ (tilda) |
| Prohibited text strings | - Any text string that starts with ASCII characters 0 to 9 (character codes 16\#30 to 16\#39) <br> - A text string that consists of only a single _ (underbar) ASCII character <br> - Any text string that includes two or more consecutive _ (underbar) ASCII characters <br> - Any text string that starts with an _ (underbar) ASCII character <br> - Any text string that ends with an _ (underbar) ASCII character <br> - Any text string that starts with ' $P_{-}$' |
| Prohibited characters | Blank space ! " \$ \& ' ( * + , - / : ; < = > ? @ [ ${ }^{\text {^` } \% ~}$ |
- Variable names cannot be used as labels.

## FOR and NEXT

FOR：Marks the starting position for repeat processing and specifies the repeat condition．
NEXT：Marks the ending position for repeat processing．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| FOR | Repeat Start | FUN | $\quad$FOR <br> －EN <br> InitVal <br> ENO <br> EndVal <br> Endex <br> StepVal | FOR Index：＝InitVal TO End－ Val BY StepVal DO expression END＿FOR＊； <br> ＊In ST，do not use NEXT to mark the ending position of repeat processing．Use END＿FOR instead． |
| NEXT | Repeat End | FUN | －NEXT <br> EN ENO |  |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| InitVal | Initial value | Input | Value to set the Index to when repetition is started． | Depends on data type． | －－－ | ＊1 |
| EndVal | End value |  | Value of Index where repeti－ tion is stopped |  |  |  |
| StepVal | Increment |  | Value to add to Index each time processing is repeated | Depends on the data type（but 0 is not allowed） |  | ＊2 |
| Index | Control variable | Output | Loop index | Depends on data type． | －－－ | －－－ |

＊1 If you omit an input parameter，the default value is not applied．A building error will occur．
＊2 If you omit the input parameter in a ladder diagram，the default value is not applied．A building error will occur．If you omit the input parameter in $S T$ ，a default value of 1 is applied．

| InitVal |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |
| EndVal | Must be the same data type as InitVal． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| StepVal | Must be the same data type as InitVal． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Index | Must be the same data type as InitVal． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The FOR and NEXT instructions repeat the processing that you place between them. (FOR and END_FOR are used in ST.) The processing procedure for a FOR-NEXT loop is as follows:

1 The value of InitVal is set in control variable Index.
2 The value of Index is checked to see if it is equal to or greater than InitVal and equal to or less than EndVal (or equal to or greater than EndVal and equal to or less than InitVal). If it is, the process moves to step 3 . If it is not, repeat processing is ended and the next instruction after the NEXT instruction (or the END_FOR instruction in ST) is moved to.

3 The processing between the FOR instruction and the NEXT instruction (or the END_FOR instruction in ST) is executed once.

4 The value of StepVal is added to Index.
5 The process returns to step 2.
The following example is for when InitVal is INT\#0, EndVal is INT\#9, and StepVal is INT\#1. The MOVE instruction is executed 10 times and INT\#0 is assigned to array variables AryOut[0] to AryOut[9].

## Additional Information

- Execute a BREAK instruction (or an EXIT instruction in ST) to cancel repeat processing. The processing between the BREAK instruction and the NEXT instruction will not be executed.
- The value of StepVal can be negative. The value of InitVal can be larger than the value of EndVal.
- FOR-NEXT loops (or FOR-END_FOR loops in ST) can be nested. In the following figure, the processes are performed in the following order.
Process $\mathrm{A} \rightarrow$ Process $\mathrm{B} \rightarrow$ Process $\mathrm{B} \rightarrow$ Process $\mathrm{C} \rightarrow$ Process $\mathrm{A} \rightarrow$ Process $\mathrm{B} \rightarrow$ Process $\mathrm{B} \rightarrow$ Process $C \rightarrow$ Process $A \rightarrow$ Process $B \rightarrow$ Process $B \rightarrow$ Process $C$

## Precautions for Correct Use

- In a ladder diagram, connect the FOR and NEXT instructions directly to the left bus bar.
- If you use this instruction in ST, you can use a function or expression that returns an integer for InitVal. You cannot use a function or expression for EndVal or StepVal.
- Always use the FOR and NEXT instructions (FOR and END_FOR statements in ST) as a pair. A programming error will occur if there is not the same number of both instructions.
- Always use the FOR-NEXT pair (the FOR-END_FOR pair in ST) in the same program section.
- If the value of InitVal is less than the value of EndVal, use a positive number for the value of StepVal. If the value of InitVal is greater than the value of EndVal, use a negative number for the value of StepVal.
- Set the condition to end repetition carefully so that you do not create an infinite loop.

Example: If the values that are given in the following table are used for the input parameters to the variables, the value of Index will never be greater than the value of EndVal because the maximum value of SINT data is 255 . Therefore, an infinite loop is created.

| Variable | Value of input parameter |
| :--- | :--- |
| InitVal | SINT\#0 |
| EndVal | SINT\#255 |
| StepVal | SINT\#1 |
| Index | --- |

- The FOR-NEXT loops can be nested up to 15 levels, but count all nesting levels for the following instructions: IF, CASE, FOR, WHILE, and REPEAT.
- If loops are nested, you will need one BREAK instruction (or one EXIT instruction in ST) for each nesting level to cancel all repeat processing.
- Do not use Jump Instructions (e.g., the JMP instruction) to interrupt repeat processing. Always use a BREAK instruction (or an EXIT instruction in ST) to cancel repeat processing.
- You can change the values of StepVal and EndVal during repeat processing. You cannot change the value of InitVal during repeat processing.
- If the value of StepVal is 0 , a task execution timeout occurs.
- Use the same data type for InitVal, EndVal, StepVal, and Index. Otherwise, a building error will occur.
- The value of Index after repeat processing is different in a ladder diagram and ST. In a ladder diagram, the value of StepVal is not added to Index at the end of repeat processing. In ST, the value of Step $V a l$ is added to Index at the end of repeat processing. Processing is repeated the same number of times.

The following example is for when InitVal is 1 , EndVal is 100 and StepVal is 1. Ladder diagram: The value of Index will be 100 after 100 repetitions.
ST: The value of Index will be 101 after 100 repetitions.

- Caution is required when you specify upward or downward differentiation for a LD, AND, or OR instruction in a FOR loop in a ladder diagram and an array is used for the LD, AND, or OR instruction.
For upward or downward differentiation, the value of the specified variable at the previous execution is compared with the value of the specified variable at the current execution to determine upward or downward differentiation. Normally, the value of the specified variable does not change every time the instruction is executed. However, if an array is specified in a FOR loop, the array element changes each time the instruction is executed. Therefore, upward or downward differentiation is determined by comparing different array elements. In the following programming, the LD instruction in the third execution of the FOR loop $(x=2)$ compares the current value $x[2]$ to the value of the specified variable the last time the LD instruction was executed, $x[1]$, to determine that the value did not change to TRUE. As a result, Count1[2] is not incremented.

In the following programming, upward differentiation of $x[i]$ is determined by the R_TRIG instruction. An instance of the R_TRIG instruction is provided for each element of $x[i]$, so it is possible to detect which element of $x[i]$ changed its value. As a result, Count2[0] to Count2[10] are all incremented.

## BREAK

The BREAK instruction is used to cancel repeat processing from the lowest level FOR instruction to the NEXT instruction.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| BREAK | Break Loop | FUN | $$ | FOR Index:=0 TO 9 BY 1 DO <br> IF Error[index] THEN <br> EXIT*; <br> END_IF <br> END_FOR; <br> * In ST, use EXIT instead of BREAK for the BREAK LOOP instruction. The meaning is the same. |

## Variables

None

## Function

The BREAK (EXIT) instruction cancels the repeat processing from the lowest level FOR instruction to the NEXT instruction (the END_FOR instruction for ST). It moves processing to the next instruction after the NEXT instruction. The processing between the BREAK instruction and the NEXT instruction (or the EXIT instruction in ST) will not be executed.
The following figure shows a programming example. When the FOR loop is executed, the value of variable $A$ is checked each time. If the value of variable $A$ is TRUE, the repeat processing is ended immediately. In this example, the Out instruction after the BREAK instruction is not executed, and the value of variable $C$ is retained. (In ST, the EXIT instruction is used instead of the BREAK instruction.)

## Precautions for Correct Use

- Always place this instruction between the FOR and NEXT instructions (or the FOR and END_FOR instructions in ST).
- If FOR-NEXT loops (or FOR-END_FOR loops in ST) are nested, you will need one BREAK instruction (or one EXIT instruction in ST) for each nesting level to cancel all repeat processing.
- Do not use Jump Instructions (e.g., the JMP instruction) to interrupt repeat processing. Always use a BREAK instruction (or an EXIT instruction in ST) to cancel repeat processing.

## Comparison Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| EQ (=) | Equal | $2-84$ |

| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The EQ（＝）instruction determines if the contents of from two to five variables $\ln 1$ to $\operatorname{InN}$ are all equiva－ lent．The comparison result Out is TRUE only when all values are equivalent．Otherwise，the value of Out is FALSE．
The following example is for when $\operatorname{In} 1$ is INT\＃3，In2 is INT\＃5 and In3 is INT\＃10．The value of variable $a b c$ will be FALSE．

## Additional Information

- The functions of the EQ instruction and the = instruction are exactly the same. Use the form that is easier to use.
- Use the EQascii instruction (page 2-91) to determine if text strings are equal.

## Precautions for Correct Use

- If the data types of $\ln 1$ to $\operatorname{InN}$ are different, they will be expanded to a data type that includes the ranges of all of the data types.
- You cannot compare bit string data (BYTE, WORD, DWORD, or LWORD) with integers. You cannot compare bit string data to real number data (SINT, INT, DINT, LINT, USINT, UDINT, ULINT, REAL, and LREAL).
- Signed integers (SINT, INT, DINT, and LINT) cannot be compared to unsigned integers (USINT, UINT, UDINT, and ULINT).
- You can compare enumerations only to other enumerations.
- If In1 to InN are real numbers, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- Two values that are positive infinity or two values that are negative infinity are equivalent.
- If any of the values of $\operatorname{ln1}$ to $I n N$ is nonnumeric data, the value of Out is FALSE.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.

## NE（＜＞）

The NE（＜＞）instruction determines if the contents of two variables are not equivalent．

| Instruction | Name | FB／FUN | Graphic expr | ession | ST expression |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NE（＜＞） | Not Equal | FUN | $\quad{ }^{(@) N E}$ $=\mathrm{EN}$ $=\ln 1$ $-\ln 2$ $=\operatorname{HN}^{(@)<>}$ $=\ln 1$ $=\ln 2$ |  | Out：＝（ln1＜＞ $\ln 2)$ ； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 and In2 | Comparison <br> data | Input | Values to compare | Depends on data type． | --- | ＊ |
| Out | Comparison <br> result | Output | Comparison result | Depends on data type． | --- | --- |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 囬 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 䍗 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \Sigma \\ & \text { 召 } \end{aligned}$ | 0 0 0 0 0 | 5 0 0 0 | ${\underset{\sim}{2}}_{\substack{C}}$ | $\sum_{-1}^{C}$ | $\sum_{\underset{1}{C}}^{0}$ | $\underset{\underset{-1}{c}}{\substack{c}}$ | $\sum_{Z}^{\infty}$ | $\underline{\text { E }}$ | $\underset{\text { Nㅡㄴ }}{0}$ | $\sum_{1}^{5}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{\rightharpoonup}{2} \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \text { N } \\ & \end{aligned}$ | 年 | $\begin{aligned} & \text { 另 } \\ & \text { m } \end{aligned}$ | 꿍 | 각 |  |
| $\ln 1$ and $\ln 2$ | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
|  | Enumerations can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The NE（＜＞）instruction determines if the contents of two variables $\operatorname{In} 1$ and $\operatorname{In} 2$ are not equivalent．If they are not equivalent，the comparison result Out is TRUE．If they are equivalent，Out is FALSE．
The following example is for when In1 equals In2（both have a value of INT\＃5）．The value of variable $a b c$ will be FALSE．
LD
ST
abc：＝（INT\＃5＜＞INT\＃5）；

## Additional Information

- The functions of the NE instruction and the <> instruction are exactly the same. Use the form that is easier to use.
- Use the NEascii instruction (page 2-93) to determine if text strings are not equal.

## Precautions for Correct Use

- If the data types of $\operatorname{In} 1$ and $\operatorname{In} 2$ are different, the smaller one is expanded to a data type that includes the ranges of both of the data types.
- You cannot compare bit string data (BYTE, WORD, DWORD, or LWORD) with integers (SINT, INT, DINT, LINT, USINT, UDINT, ULINT). You cannot compare bit string data with real number data (REAL and LREAL).
- Signed integers (SINT, INT, DINT, and LINT) cannot be compared to unsigned integers (USINT, UINT, UDINT, and ULINT).
- You can compare enumerations only to other enumerations.
- If In1 and In2 are real numbers, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- Two values that are positive infinity or two values that are negative infinity are equivalent.
- If the value of either $\ln 1$ or $\operatorname{In} 2$ is nonnumeric data, the value of Out is FALSE.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.

## LT (<), LE (<=), GT (>), and GE (>=)

These instructions compare the sizes of two or more values.
LT (<): Performs a less than comparison.
LE (<<): Performs a less than or equal comparison.
GT (>): Performs a greater than comparison.
GE ( $>=$ ): Performs a greater than or equal comparison.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| LT (<) | Less Than | FUN |  | $\begin{aligned} & \text { Out:=(ln1<ln2) \& (ln2<ln3) } \\ & \& \cdots \\ & (\operatorname{lnN}-1<\ln N) ; \end{aligned}$ |
| LE (<=) | Less Than Or Equal | FUN |  | $\begin{aligned} & \text { Out:=(ln1<=\|n2) \& } \\ & (\ln 2<=\ln 3) \& \ldots \& \\ & (\operatorname{lnN} N-1<=\ln N) ; \end{aligned}$ |
| GT (>) | Greater Than | FUN |  | $\begin{aligned} & \text { Out:=(ln1>\|n2) \& (ln2>\|n3) } \\ & \& \ldots \text { \& } \\ & (\operatorname{lnN}-1>\operatorname{lnN}) ; \end{aligned}$ |
| GE (>=) | Greater Than Or Equal | FUN |  | $\begin{aligned} & \text { Out:=(ln1>=\|n2) \& } \\ & (\ln 2>=\ln 3) \& \ldots \& \\ & (\operatorname{lnN} 1>=\ln N) ; \end{aligned}$ |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to InN | Comparison <br> data | Input | Values to compare， $\mathrm{N}=2$ to <br> 5 | Depends on data type． | --- | $0^{*}$ |
| Out | Comparison <br> result | Output | Comparison result | Depends on data type． | --- | --- |

＊If you omit the input parameter that connects to $\operatorname{InN}$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\ln 1$ and $\ln 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

|  |  |  | Bit s | ings |  |  |  |  | Int | gers |  |  |  |  |  |  | mes | du |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| In1 to InN |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions compare the values of $\operatorname{In} 1$ to $\operatorname{In} N(\mathrm{~N}=2$ to 5$)$ ．
The output value Out is shown below for each instruction．

| Instruction | Value of Out |
| :--- | :--- |
| LT $(<)$ | If $\ln 1<\ln 2<\ldots<\operatorname{In} N$, Out is TRUE．Otherwise，it is FALSE． |
| LE（＜＝） | If $\ln 1<=\ln 2<=\ldots<=\ln N$, Out is TRUE．Otherwise，it is FALSE． |
| GT $(>)$ | If $\ln 1>\ln 2>\ldots>\ln N$, Out is TRUE．Otherwise，it is FALSE． |
| GE $(>=)$ | If $\ln 1>=\ln 2>=\ldots>=\ln N$, Out is TRUE．Otherwise，it is FALSE． |

The following example shows the LE instruction when $\ln 1$ is $\operatorname{INT} \# 3, \ln 2$ is INT\＃5 and $\operatorname{In} 3$ is INT\＃10．The value of variable $a b c$ will be TRUE．

LD

## Additional Information

－The functions of the LT and＜instructions，the LE and＜＝instructions，the GT and＞instructions，and the GE and＞＝instructions are exactly the same．Use the form that is easier to use．
－Use the LTascii，LEascii，GTascii，and GEascii instructions（page 2－95）to compare the sizes of text strings．

## Precautions for Correct Use

- If the data types of $\operatorname{In} 1$ to $\operatorname{In} N$ are different, they will be expanded to a data type that includes the ranges of all of the data types.
- Signed integers (SINT, INT, DINT, and LINT) cannot be compared to unsigned integers (USINT, UINT, UDINT, and ULINT).
- If $\ln 1$ to $\operatorname{InN} 2$ are real numbers, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- Two values that are positive infinity or two values that are negative infinity are equivalent.
- If any of the values of $\operatorname{In} 1$ to $I n N$ is nonnumeric data, the value of Out is FALSE.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.

## EQascii

The EQascii instruction determines if two or more text strings are all equivalent．

| Instruction | Name | FB／FUN | Graphic expression |  | ST expression |
| :---: | :---: | :---: | :---: | :---: | :---: |
| EQascii | Text String Com－ parison Equal | FUN |  | －Out | ```Out:=EQascii(In1, .., InN);``` |

Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to InN | Comparison <br> text strings | Input | Text strings to compare， $\mathrm{N}=$ <br> 2 to 5 | Depends on data type． | --- | ＂＊ |
| Out | Comparison <br> result | Output | Comparison result | Depends on data type． | --- | --- |

＊If you omit the input parameter that connects to $\operatorname{InN}$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\ln 1$ and $\ln 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

## Function

The EQascii instruction determines if from two to five text strings $\operatorname{In} 1$ to $\operatorname{In} N$ are all equivalent．If the are all equivalent，comparison result Out changes to TRUE．Otherwise，the value of Out is FALSE．＂Equiva－ lent＂means that both the lengths and contents of the text strings are the same．
The following example is for when $\ln 1$ is＂$A$＂， $\operatorname{In} 2$ is＂$A B$＂，and $\operatorname{In} 3$ is＂$A B C$＂．The value of variable $a b c$ will be FALSE．

LD

ST
abc：＝EQascii（＇A＇，＇AB＇，＇ABC＇）；

## Additional Information

The text string comparison instructions are convenient when you want to reorder text strings according to the character codes. For example, the character codes for alphabet characters are in the same order as the alphabet characters. This allows you to alphabetize.

## Precautions for Correct Use

- Do not use this instruction as the rightmost instruction on a rung. If you do, an error occurs on the Sysmac Studio and you cannot transfer the user program to the Controller.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.
- Specify text strings that contain only ASCII characters for In1 to $\operatorname{InN}$.
- An error occurs in the following case. Out will be FALSE.
- One of the text strings in $\operatorname{In} 1$ to $\operatorname{In} N$ does not end in a NULL character.

## NEascii

The NEascii instruction determines if two text strings are not equivalent．

| Instruction | Name | FB／FUN | Graphic expression |  | ST expression |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NEascii | Text String Com－ parison Not Equal | FUN |  ${ }^{(@)}$（ NEascii <br> $=$ $E N$ <br> $=$ $\ln 1$ <br> $\ln 2$  | －Out | Out：＝NEascii（In1，In2）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |

\end{tabular}

## Function

These instructions compare the sizes of from two to five text strings in $\operatorname{In} 1$ to $\operatorname{In} N(N=2$ to 5$)$ ．The out－ put value Out is shown below for each instruction．

| Instruction | Value of Out |
| :--- | :--- |
| LTascii | If $\ln 1<\ln 2<\ldots<\operatorname{In} N$, Out is TRUE．Otherwise，it is FALSE． |
| LEascii | If $\ln 1 \leq \ln 2 \leq \ldots \leq \ln N$, Out is TRUE．Otherwise，it is FALSE． |
| GTascii | If $\operatorname{In} 1>\ln 2>\ldots>\ln N$, Out is TRUE．Otherwise，it is FALSE． |
| GEascii | If $\ln 1 \geq \ln 2 \geq \ldots \geq \ln N$, Out is TRUE．Otherwise，it is FALSE． |

The sizes of the character codes are compared．The comparison procedure is as follows：
First，the first character codes in all of the text strings are compared．If the character codes are different， the result of the size comparison for the text strings is determined by the size relationship between those character codes．If the character codes are the same，comparison continues in order to the other characters until a different character code is found．If the lengths of the text strings are different，NULL characters（16\＃00）are added to the shorter text string to complete the comparison．
The relationships between various text strings are as follows：

```
'AD'(16#414400) < 'BC'(16#424400)
'ADC' (16#41444300)< 'B'(16#42000000)
'ABC' (16#41424300)< 'ABD'(16#41424400)
'ABC' (16#41424300)> 'AB'(16#41420000)
'AB' (16#414200)= 'AB'(16#414200)
```

If the text string contains multi－byte characters，the characters are separated into individual bytes before comparison．For example，the two－byte character 16\＃C281 is handled as 16\＃C2 and 16\＃81．
The following example for the LEascii instruction is for when $\ln 1$ is＂$A B$＂， $\ln 2$ is＂$A C$＂，and $\operatorname{In} 3$ is＂$A C$＂． The value of variable $a b c$ will be TRUE．

## Additional Information

The text string comparison instructions are convenient when you want to reorder text strings according to the character codes. For example, the character codes for alphabet characters are in the same order as the alphabet characters. This allows you to alphabetize.

## Precautions for Correct Use

- Do not use this instruction as the rightmost instruction on a rung. If you do, an error occurs on the Sysmac Studio and you cannot transfer the user program to the Controller.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.
- Specify text strings that contain only ASCII characters for In1 to $\operatorname{InN}$.
- An error occurs in the following case. Out will be FALSE.
- One of the text strings in $\operatorname{In} 1$ to $\operatorname{In} N$ does not end in a NULL character.

## Cmp

The Cmp instruction compares two values．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Cmp | Compare | FUN |  | Out：＝Cmp（In1，In2，OutEQ， OutGT，OutGE，OutNE， OutLT，OutLE）； <br> You can omit Out． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 and In2 | Comparison data | Input | Values to compare | Depends on data type． | －－－ | ＊ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |
| OutEQ | Equal flag |  | Equal flag | Depends on data type． |  |  |
| OutGT | Greater than flag |  | Greater than flag |  |  |  |
| OutGE | Greater than or equal flag |  | Greater than or equal flag |  |  |  |
| OutNE | Not equal flag |  | Not equal flag |  |  |  |
| OutLT | Less than flag |  | Less than flag |  |  |  |
| OutLE | Less than or equal flag |  | Less than or equal flag |  |  |  |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

## Function

The Cmp instruction compares two values ( $\ln 1$ and $\ln 2$ ) and outputs flag values.
The values of the flags are as follows:

| Flag | Value |
| :--- | :--- |
| OutEQ | If In1 equals In2, the flag shows TRUE. Otherwise the flag shows FALSE. |
| OutGT | If In1 is greater than In2, the flag shows TRUE. Otherwise the flag shows <br> FALSE. |
| OutGE | If In1 is greater than or equal to In2, the flag shows TRUE. Otherwise the <br> flag shows FALSE. |
| OutNE | If In1 is not equal to In2, the flag shows TRUE. Otherwise the flag shows <br> FALSE. |
| OutLT | If In1 is less than In2, the flag shows TRUE. Otherwise the flag shows <br> FALSE. |
| OutLE | If In1 is less than or equal to In2, the flag shows TRUE. Otherwise the flag <br> shows FALSE. |

The following example is for when $\operatorname{In} 1$ is INT\#10 and In2 is INT\#20. The values of variables def, ghi, and $j k /$ will be FALSE, and the values of $a b c, m n o, p q r$, and $s t u$ will be TRUE.

## Precautions for Correct Use

- If the data types of $\operatorname{In} 1$ and $\operatorname{In} 2$ are different, the smaller one is expanded to a data type that includes the ranges of both of the data types.
- If In1 and In2 are real numbers, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- Signed integers (SINT, INT, DINT, and LINT) cannot be compared to unsigned integers (USINT, UINT, UDINT, and ULINT).
- Two values that are positive infinity or two values that are negative infinity are equivalent.
- If the value of either $\operatorname{In} 1$ or $\operatorname{In} 2$ is nonnumeric data, the values of OutEQ, OutGT, OutGE, OutNE, OutLT, and OutLE are FALSE.

## ZoneCmp

The ZoneCmp instruction determines if the comparison data is within the specified maximum and mini－ mum values．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ZoneCmp | Zone Comparison | FUN |  | Out：＝ZoneCmp（MN，In， MX）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MN | Minimum value | Input | Minimum value | Depends on data type． | －－－ | 0 |
| In | Comparison data |  | Value to compare |  |  | ＊ |
| MX | Maximum value |  | Maximum value |  |  | 0 |
| Out | Comparison result | Output | Comparison result | Depends on data type． | －－－ | －－－ |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  |  |  | Bit | ings |  |  |  |  | Inte | gers |  |  |  |  |  |  | mes | dur |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { D } \\ & \underset{\sim}{\boldsymbol{m}} \end{aligned}$ | $\sum$ § D | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { OD } \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\underset{1}{\mathrm{Z}}}{\substack{C}}$ | $\frac{\text { 들 }}{}$ | $\underset{\underset{1}{c}}{\underset{1}{c}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\underset{-1}{ }$ | ${\underset{Z}{2}}_{2}^{2}$ | $\sum_{\underset{1}{\prime}}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 艿 } \\ & \mathbb{m} \end{aligned}$ | $\frac{\text { 글 }}{\overline{1}}$ | $\begin{aligned} & \text { 号 } \\ & \text { H } \end{aligned}$ | 음 | 먹 | 足 |
| MN |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| MX |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The ZoneCmp instruction determines if comparison data In is between maximum value $M X$ and minimum value $M N$. If $M X \geq \ln \geq M N$, Out will be TRUE. Otherwise, Out will be FALSE.
The following example is for when $M N$ is INT\#10, In is INT\#20 and $M X$ is INT\#30. The value of variable $a b c$ will be TRUE.

## ST

abc:=ZoneCmp(INT\#10, INT\#20, INT\#30);

## Precautions for Correct Use

- If the data types of $I n, M X$, and $M N$ are different, they will be expanded to a data type that includes the ranges of all of the data types.
- If $I n, M X$, and $M N$ are real numbers, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- Signed integers (SINT, INT, DINT, and LINT) cannot be compared to unsigned integers (USINT, UINT, UDINT, and ULINT).
- Two values that are positive infinity or two values that are negative infinity are equivalent.
- If the value of $I n$ is nonnumeric data, the value of Out is FALSE.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.
- An error occurs in the following cases. Out will be FALSE.
- The value of $M N$ is greater than the value of $M X$.
- Either MX or MN contains nonnumeric data.

## TableCmp

The TableCmp instruction compares the comparison data with multiple defined ranges in a comparison table.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TableCmp | Table Comparison | FUN |  | Out:=TableCmp(In, Table, Size, AryOut); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Comparison data | Input | Value to compare | Depends on data type. | --- |  |
| Table[] (two-dimensional array) | Comparison table |  | Two-dimensional array that contains the elements for the defined ranges |  |  | * |
| Size | Comparison size |  | Number of elements in Table[] to which to compare In |  |  | 1 |
| AryOut[] (array) | Individual comparison results array | In-out | Comparison results for Table[] elements <br> TRUE: Condition met. <br> FALSE: Condition not met. | Depends on data type. | --- | --- |
| Out | Comparison result | Output | TRUE: In meets all comparison conditions for elements of Table[]. <br> FALSE: The comparison condition is not met for one or more sets of elements. | Depends on data type. | --- | --- |

[^4]

## Function

The TableCmp instruction compares comparison data In with the number of defined ranges specified by the value of Size in comparison table Table[].
Table[] is a two-dimensional array. The first dimension contains the numbers of the defined ranges. In the second dimension, element 0 is set value $A$ of the defined range and element 1 is set value $B$ of the defined range.

Set value $A$ and set value $B$ define range as shown below. Set value $A$ and set value $B$ are always included in the range.

Set value $A \geq$ Set value $B$

The results of comparing In and Table[] are stored in individual comparison results array AryOut[]. If In is within the defined range for element $i$, ArayOut[i] will be TRUE. If it is not within the range, ArayOut[i] will be FALSE. If all Size elements of AryOut[] are TRUE, comparison result Out will be TRUE. Otherwise, it will be FALSE.

The following example is for when In is INT\#120 and Size is UINT\#3.

## Precautions for Correct Use

- Use the same data type for In and Table[]. Otherwise, a compiling error will occur.
- Use a two-dimensional array for Table[]. A compiling error will occur if you use any other size of array.
- If an array with more than two dimensions is used for Table[], the elements in the third and higher dimensions are ignored.
- If the AryOut[] array is larger than the value of Size, the comparison results will be stored in AryOut[0] to AryOut[Size-1]. Other elements of the array will not change.
- Signed integers (SINT, INT, DINT, and LINT) cannot be compared to unsigned integers (USINT, UINT, UDINT, and ULINT).
- If real numbers are compared, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- If the value of Size is 0 , the value of Out will be FALSE and AryOut[] will not change.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.
- An error occurs in the following cases. Out will be FALSE.
- If the value of Size exceeds the size of the AryOut[] array.
- If the value of Size exceeds the size of the first dimension of the Table[] array.
- The size of the second dimension of Table [] is 1.

## AryCmpEQ and AryCmpNE

These instructions compare the values of the elements of two arrays．
AryCmpEQ：Determines if the elements are equal．
AryCmpNE：Determines if the elements are not equal．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryCmpEQ | Array Comparison Equal | FUN |  | AryCmpEQ（In1，In2，Size， AryOut）； |
| AryCmpNE | Array Comparison Not Equal | FUN |  | AryCmpNE（In1，In2，Size， AryOut）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1［］and In2［］ （arrays） | Comparison arrays | Input | Arrays containing the ele－ ments to compare | Depends on data type． | －－－ | ＊ |

| $\ln 1[]$（array） | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In2［］（array） | Must be an array with the same data type as $\ln 1[]$. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions compare the values of the elements with the same element numbers in two arrays ( $\ln 1[0]$ to $\operatorname{In} 1[$ Size-1] and $\operatorname{In} 2[0]$ and $\operatorname{In} 2[S i z e-1])$. The comparison results are stored in comparison results array AryOut[] in the elements with the corresponding element numbers (AryOut[0] to Ary-Out[Size-1]).
The value of AryOut[i] is as follows for each instruction:

| Instruction | Value of AryOut $[i]$ |
| :--- | :--- |
| AryCmpEQ | If $\ln 1[i]=\ln 2[i]$, the result is TRUE. Otherwise, it is FALSE. |
| AryCmpNE | If $\ln 1[i] \neq \ln 2[i]$, the result is TRUE. Otherwise, it is FALSE. |

The following example shows the AryCmpEQ instruction when Size is UINT\#3.

## Precautions for Correct Use

- Use the same data type for $\operatorname{In} 1[]$ and $\operatorname{In} 2[]$.
- Use an AryOut[] array that is at least as large as the value of Size.
- If $\operatorname{In} 1[]$ and $\operatorname{In} 2[]$ contain real numbers, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- If the value of Size is 0 , the value of Out will be TRUE and AryOut[] will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- If In1[] and In2[] contain different data types.
- If the In1[], In2[], or AryOut[] array is smaller than the value of Size.

## AryCmpLT, AryCmpLE, AryCmpGT, and AryCmpGE

These instructions compare the values of the elements of two arrays.
AryCmpLT: Performs a less than comparison.
AryCmpLE: Performs a less than or equal comparison.
AryCmpGT: Performs a greater than comparison.
AryCmpGE: Performs a greater than or equal comparison.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryCmpLT | Array Comparison Less Than | FUN |  | AryCmpLT(In1, In2, Size, AryOut); |
| AryCmpLE | Array Comparison Less Than Or Equal | FUN |  | AryCmpLE(In1, In2, Size, AryOut); |
| AryCmpGT | Array Comparison Greater Than | FUN |  | $\begin{aligned} & \text { AryCmpGT(In1, In2, Size, } \\ & \text { AryOut); } \end{aligned}$ |
| AryCmpGE | Array Comparison Greater Than Or Equal | FUN |  | $\begin{aligned} & \text { AryCmpGE(In1, In2, Size, } \\ & \text { AryOut); } \end{aligned}$ |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1[] and In2[] (arrays) | Comparison arrays | Input | Arrays containing the elements to compare | Depends on data type. | --- | * |
| Size | Number of comparison elements |  | Number of elements to compare | Depends on data type. |  | 1 |
| AryOut[] (array) | Comparison results array | In-out | Comparison results array | Depends on data type. | --- | --- |
| Out | Return value | Output | Always TRUE | TRUE only | --- | --- |

* If you omit an input parameter, the default value is not applied. A building error will occur.

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times, durations, dates, and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\ln 1[]$ (array) |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |
| In2[] (array) | Must be an array with the same data type as $\ln 1[]$. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut] (array) | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions compare the values of the elements with the same element numbers in two arrays $(\ln 1[0]$ to $\ln 1[$ Size -1] and $\ln 2[0]$ and $\operatorname{In} 2[$ Size -1$]$ ). The comparison results are stored in comparison results array AryOut[] in the elements with the corresponding element numbers (AryOut[0] to Ary-Out[Size-1]).
The value of AryOut[i] is as follows for each instruction:

| Instruction | Value of AryOut[i] |
| :--- | :--- |
| AryCmpLT | If $\operatorname{In} 1[i]<\operatorname{In} 2[i]$, the result is TRUE. Otherwise, it is FALSE. |
| AryCmpLE | If $\operatorname{In} 1[i]<=\ln 2[i]$, the result is TRUE. Otherwise, it is FALSE. |
| AryCmpGT | If $\operatorname{In} 1[i]>\operatorname{In} 2[i]$, the result is TRUE. Otherwise, it is FALSE. |
| AryCmpGE | If $\ln 1[i]>=\ln 2[i]$, the result is TRUE. Otherwise, it is FALSE. |

The following example shows the AryCmpLT instruction when Size is UINT\#3.
LD
ST

AryCmpLT(abc[1], def[2], UINT\#3, ghi[3]);

| Size=UINT\#3 | [ $\ln 1[0]=\mathrm{abc}[1]$ | 110 | $\ln 2[0]=$ def[2] | 100 | $\longrightarrow$ AryOut[0]=ghi[3] | FALSE |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\ln 1[1]=a b c[2]$ | 120 | $\ln 2[1]=\mathrm{def}[3]$ | 130 | $\rightarrow$ AryOut[1]=ghi[4] | TRUE |
|  | $\ln 1[2]=a b c[3]$ | 140 | $\ln 2[2]=\operatorname{def}[4]$ | 160 | $\rightarrow$ AryOut[2]=ghi[5] | TRUE |

## Precautions for Correct Use

- Use the same data type for $\operatorname{In} 1[]$ and $\operatorname{In} 2[]$.
- Use an AryOut[] array that is at least as large as the value of Size.
- If In1[] and In2[] contain real numbers, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- If the value of Size is 0 , the value of Out will be TRUE and AryOut[] will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- If In1[] and In2[] contain different data types.
- If the In1[], In2[], or AryOut[] array is smaller than the value of Size.

## AryCmpEQV and AryCmpNEV

These instructions compare a value to the values of the elements of an array．
AryCmpEQV：Determines if the elements are equal．
AryCmpNEV：Determines if the elements are not equal．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryCmpEQV | Array Value Com－ parison Equal | FUN |  | AryCmpEQV（In1，In2，Size， AryOut）； |
| AryCmpNEV | Array Value Com－ parison Not Equal | FUN |  | AryCmpNEV（In1，In2，Size， AryOut）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1［］（array） | Comparison array | Input | Array containing the ele－ ments to compare | Depends on data type． | －－－ | ＊ |

## Function

These instructions compare comparison value $\operatorname{In} 2$ with the specified elements in an array ( $\ln 1[0]$ to $\operatorname{In} 1[$ Size -1]). The comparison results are stored in comparison results array AryOut[] in the elements with the corresponding element numbers (AryOut[0] to AryOut[Size -1]).

The value of AryOut[i] is as follows for each instruction:

| Instruction | Value of AryOut[i] |
| :--- | :--- |
| AryCmpEQV | If $\operatorname{In} 1[i]=\operatorname{In} 2$, the result is TRUE. Otherwise, it is FALSE. |
| AryCmpNEV | If $\operatorname{In} 1[i] \neq \operatorname{In} 2$, the result is TRUE. Otherwise, it is FALSE. |

The following example shows the AryCmpEQV instruction when In2 is INT\#10 and Size is UINT\#3.
LD

ST
AryCmpEQV(abc[1], INT\#10, UINT\#3, def[2]);

## Precautions for Correct Use

- Use the same data type for $\operatorname{In} 1[]$ and $\operatorname{In} 2$.
- Use an AryOut[] array that is at least as large as the value of Size.
- If $\operatorname{In1}[]$ contains real numbers and $I n 2$ is a real number, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- If the value of Size is 0 , the value of Out will be TRUE and AryOut[] will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE, and AryOut[] will not change.
- If the In1[] or AryOut[] array is smaller than the value of Size.

## AryCmpLTV, AryCmpLEV, AryCmpGTV, and AryCmpGEV

These instructions compare a value to the values of the elements of an array.
AryCmpLTV: Performs a less than comparison.
AryCmpLEV: Performs a less than or equal comparison.
AryCmpGTV: Performs a greater than comparison.
AryCmpGEV: Performs a greater than or equal comparison.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryCmpLTV | Array Value Comparison Less Than | FUN |  | AryCmpLTV(In1, In2, Size, AryOut); |
| AryCmpLEV | Array Value Comparison Less Than Or Equal | FUN |  | AryCmpLEV (In1, In2, Size, AryOut); |
| AryCmpGTV | Array Value Comparison Greater Than | FUN |  | AryCmpGTV(In1, In2, Size, AryOut); |
| AryCmpGEV | Array Value Comparison Greater Than Or Equal | FUN |  | AryCmpGEV(In1, In2, Size, AryOut); |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln 1[]$（array） | Comparison array | Input | Array containing the ele－ ments to compare | Depends on data type． | －－－ | ＊ |
| In2 | Comparison value |  | Value to compare |  |  |  |
| Size | Number of comparison elements |  | Number of elements to com－ pare | Depends on data type． |  | 1 |
| AryOut［］ （array） | Comparison results array | In－out | Comparison results array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { 毋o } \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\ln 1{ }^{\text {［］}}$（array） |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |
| In2 | Must be same data type as the elements of In1［］． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions compare comparison value $\operatorname{In} 2$ with the specified elements in an array ( $\ln 1[0]$ to In1[Size - 1]). The comparison results are stored in comparison results array AryOut[] in the elements with the corresponding element numbers (AryOut[0] to AryOut[Size -1]).
The value of AryOut[i] is as follows for each instruction:

| Instruction | Value of AryOut $[i]$ |
| :--- | :--- |
| AryCmpLTV | If $\operatorname{In} 1[i]<\operatorname{In} 2$, the result is TRUE. Otherwise, it is FALSE. |
| AryCmpLEV | If $\operatorname{In} 1[i]<=\operatorname{In} 2$, the result is TRUE. Otherwise, it is FALSE. |
| AryCmpGTV | If $\operatorname{In1}[i]>\operatorname{In} 2$, the result is TRUE. Otherwise, it is FALSE. |
| AryCmpGEV | If $\operatorname{In1}[[i]>=\operatorname{In} 2$, the result is TRUE. Otherwise, it is FALSE. |

The following example shows the AryCmpLEV instruction when In2 is INT\#20 and Size is UINT\#3.

## Precautions for Correct Use

- Use the same data type for $\operatorname{In} 1[]$ and $\operatorname{In} 2$.
- Use an AryOut[] array that is at least as large as the value of Size.
- If $\operatorname{In} 1[]$ contains real numbers and $\operatorname{In} 2$ is a real number, error may cause unexpected processing results. This can occur, for example, when they contain non-terminating decimal numbers.
- If the value of Size is 0 , the value of Out will be TRUE and AryOut[] will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE, and AryOut[] will not change.
- If the $\operatorname{In} 1[]$ or AryOut[] array is smaller than the value of Size.

## Timer Instructions

| Instruction | Name | Page |
| :--- | :--- | :--- |
| TON | On-Delay Timer | $2-116$ |
| TOF | Off-Delay Timer | $2-120$ |
| TP | Timer Pulse | $2-123$ |
| AccumulationTimer | Accumulation Timer | $2-126$ |
| Timer | Hundred-ms Timer | $2-129$ |

## TON

The TON instruction outputs TRUE when the set time elapses after the timer starts．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TON | On－Delay Timer | FB |  | ```TON_instance (In, PT, Q, ET);``` |

## Variables

| Q | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ET |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |

## Function

The TON instruction outputs TRUE when the set time elapses after the timer starts．Set the time in nanoseconds（ns）．The timing accuracy is 100 ns ．The timer starts when timer input In changes to TRUE．Elapsed time $E T$ is incremented as time elapses．When $E T$ reaches set time $P T$ ，timer output $Q$ changes to TRUE．$E T$ is not incremented after that．The timer is reset when In changes to FALSE．ET changes to 0 and $Q$ changes to FALSE．
If the timer is started and then In changes to FALSE before $E T$ reaches $P T$ ，the timer is reset．

The following figure shows a programming example and timing chart when $P T$ is $\mathrm{T} \# 10 \mathrm{~ms}$. Variable $a b c$ will change to TRUE 10 ms after variable $A$ changes to TRUE.

## Additional Information

- Use the TP instruction (page 2-123) for a timer that changes the timer output to TRUE when timing starts and then changes the timer output to FALSE when the set time is reached.
- Use the TOF instruction (page 2-120) for a timer that starts when In changes to FALSE and then changes the timer output to FALSE when the elapsed time reaches the set time.
- To reduce timer execution time, use the Timer instruction (page 2-129), which times in increments of 100 ms .

## Precautions for Correct Use

- $E T$ and $Q$ are updated only when the instruction is executed. Therefore, $Q$ does not change to TRUE precisely when the elapsed time from when the timer starts reaches PT. Q changes to TRUE the next time the instruction is executed after the elapsed time from when the timer starts reaches PT. The change in $Q$ can therefore occur with a delay of up to one task period.
- Set $P T$ and $E T$ in nanoseconds (ns), but remember the timing accuracy is 100 ns .
- The timer starts as soon as operation starts if $I n$ is already TRUE.
- If T\#Oms or a negative number is set for PT, $Q$ will change to TRUE as soon as the value of In changes to TRUE.
- You can change the value of $P T$ while the value of $I n$ is TRUE. Operation is as follows:

| Timer status | Value of $\boldsymbol{Q}$ | Value of $\boldsymbol{P T}$ after it is <br> changed | Operation |
| :--- | :--- | :--- | :--- |
| After comple- <br> tion of timing | TRUE | --- | The value of $Q$ remains TRUE. <br> The value of $E T$ also does not change. (It remains at <br> the value of $P T$ before it was changed.) |
| Timing in <br> progress | FALSE | $P T \geq E T$ | Timing is continued. When the value of $E T$ reaches <br> the value of $P T$, the value of $Q$ changes to TRUE and <br> $E T$ is no longer incremented. |

[^5]- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of $E T$ is not updated. However, timing still continues. Therefore, $E T$ is updated to the correct value the next time the instruction is executed.
- If this instruction is used in a ladder diagram, the value of $Q$ changes to FALSE if an error occurs in the previous instruction on the rung.

## Sample Programming

## - Measuring Time with One On-Delay Timer

The value of TimeUp will change to TRUE 1 second after the value of Trigger changes to TRUE.
LD

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| Trigger | BOOL | False | Execution condition |
| TimeUp | BOOL | False | Timer output |
| TON_instance | TON |  |  |

ST

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| Trigger | BOOL | False | Execution condition |
| TimeUp | BOOL | False | Timer output |
| TON_instance | TON |  |  |

```
IF (Trigger=TRUE) THEN
    TON_instance(In:=TRUE, PT:=T#1s, Q=>TimeUp);
ELSE
    TON_instance(In:=FALSE, Q=>TimeUp);
END_IF;
```

The following ST programming performs the same operation.
ST

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| Trigger | BOOL | False | Execution condition |
| TimeUp | BOOL | False | Timer output |
| TON_instance | TON |  |  |

TON_instance(In:=Trigger, PT:=T\#1s, Q=>TimeUp);

## - Measuring Time with Multiple On-Delay Timers

In this example, a total of 100 instances of the On-Delay Timer instruction, TON_instance[0] to TON_instance[99], are programmed. Each timer starts when the value of the corresponding timer input Input[0] to Input[99] changes to TRUE.
The timers for the first 10 instances, TON_instance[0] to TON_instance[9], change the corresponding values in TimeUp[i] to TRUE $\mathrm{i}+1$ seconds ( $\mathrm{i}=0$ to 9 ) after execution is started.
The timers for the remaining 90 instances, TON_instance[10] to TON_instance[99], change the corresponding values in TimeUp[i] ( $\mathrm{i}=10$ to 99 ) to TRUE as soon as execution is started.

TON_instance[0]
(L) $\xrightarrow{\text { 1s }}$ TimeUp[0] TRUE

TON_instance[1]
(L) $\xrightarrow{2 s}$ TimeUp[1] TRUE

TON_instance[9]

TON_instance[10]

TON_instance[99]

LD

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| Input | ARRAY[0..99] OF BOOL | $[100$ (False)] | Timer input |
| TimeUp | ARRAY[0..99] OF BOOL | $[100($ False) $]$ | Timer output |

FOR i:=0 TO 99 DO
TON_instance[i](
In := Input[i],
PT:= TimePT[i],
Q =>TimeUp[i]);
END_FOR;

## TOF

The TOF instruction outputs FALSE when the set time elapses after the timer starts.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TOF | Off-Delay Timer | FB |  | TOF_instance (In, PT, Q, ET); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Timer input | Input | TRUE: Timer reset signal FALSE: Timer start signal | Depends on data type. | --- | FALSE |
| PT | Set time |  | Time from when timer starts until $Q$ changes to FALSE | * | ms | 0 |
| Q | Timer output | Output | TRUE: Timer output ON <br> FALSE: Timer output OFF | Depends on data type. | --- | --- |
| ET | Elapsed time |  | Elapsed time since timer started | * | ms |  |

* T\#0ms to T\#106751d_23h_47m_16s_854.775807ms

## Function

The TOF instruction outputs FALSE when the set time elapses after the timer starts. Set the time in nanoseconds (ns). The timing accuracy is 100 ns . The timer starts when timer input In changes to FALSE. Elapsed time $E T$ is incremented as time elapses. When $E T$ reaches set time $P T$, timer output $Q$ changes to FALSE. $E T$ is not incremented after that. The timer is reset when In changes to TRUE. ET changes to 0 and $Q$ changes to TRUE.
If the timer is started and then In changes to FALSE before $E T$ reaches $P T$, the timer is reset.

The following figure shows a programming example and timing chart for a $P T$ of T\#10ms. Variable abc will change to FALSE 10 ms after variable $A$ changes to FALSE.

## Additional Information

- Use the TP instruction (page 2-123) for a timer that changes the timer output to TRUE when timing starts and then changes the timer output to FALSE when the set time is reached.
- Use the TON instruction (page 2-116) for a timer that starts when In changes to TRUE and then changes the timer output to TRUE when the elapsed time reaches the set time.

## Precautions for Correct Use

- $E T$ and $Q$ are updated only when the instruction is executed. Therefore, $Q$ does not change to FALSE precisely when the elapsed time from when the timer starts reaches PT. Q changes to FALSE the next time the instruction is executed after the elapsed time from when the timer starts reaches PT. The change in $Q$ can therefore occur with a delay of up to one task period.
- Set $P T$ and $E T$ in nanoseconds (ns), but remember the timing accuracy is 100 ns .
- If T\#Oms or a negative number is set for PT, $Q$ will change to FALSE as soon as the value of In changes to FALSE.
- The value of $Q$ changes to TRUE immediately after execution of this instruction regardless of the value of $I n . Q$ is FALSE from only when the timer is started until the time that is set with $P T$ elapses.
- You can change the value of $P T$ while the value of $I n$ is FALSE. Operation is as follows:

| Timer status | Value of $Q$ | Value of $\boldsymbol{P T}$ after it is <br> changed | Operation |
| :--- | :--- | :--- | :--- |
| After comple- <br> tion of timing | FALSE | --- | The value of $Q$ remains FALSE. <br> The value of $E T$ also does not change. (It remains at <br> the value of $P T$ before it was changed.) |
|  |  | $P T \geq E T$ | Timing is continued. When the value of $E T$ reaches <br> the value of $P T$, the value of $Q$ changes to FALSE <br> and $E T$ is no longer incremented. |
| Timing in <br> progress | TRUE | $P T<E T$ | The value of $Q$ changes to FALSE immediately. <br> Incrementing $E T$ stops immediately. |
|  |  |  |  |

- If this instruction is in a master control region and the master control region is reset, the operation is as follows:
- The value of $E T$ changes to 0 and the value of $Q$ changes to TRUE.
- If an Out instruction is connected to $Q$, the execution condition to the Out instruction is FALSE.
- Timing starts as soon as the reset is released.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of $E T$ is not updated. However, timing still continues. Therefore, $E T$ is updated to the correct value the next time the instruction is executed.
- If this instruction is used in a ladder diagram, the value of $Q$ changes to FALSE if an error occurs in the previous instruction on the rung.

## TP

The TP instruction outputs TRUE while the set time elapses after the timer starts.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TP | Timer Pulse | FB |  | ```TP_instance (In, PT, Q, ET);``` |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Timer input | Input | TRUE: Timer start signal FALSE: Timer reset signal | Depends on data type. | --- | FALSE |
| PT | Set time |  | Time that $Q$ remains at TRUE | * | ms | 0 |
| Q | Timer output | Output | TRUE: Timer output ON <br> FALSE: Timer output OFF | Depends on data type. | --- |  |
| ET | Elapsed time |  | Elapsed time since timer started | * | ms |  |

* T\#0ms to T\#106751d_23h_47m_16s_854.775807ms

## Function

The TP instruction outputs TRUE while the set time elapses after the timer starts. Set the time in nanoseconds (ns). The timing accuracy is 100 ns . The timer starts when timer input In changes to TRUE and timer output $Q$ changes to TRUE. Elapsed time $E T$ is incremented as time elapses. When $E T$ reaches set time $P T$, timer output $Q$ changes to FALSE. $E T$ is not incremented after that. The timer is reset when In changes to FALSE. ET changes to 0 . The timer is not reset even if In changes to FALSE after the timer starts but before $E T$ reaches $P T$.

The following figure shows a programming example and timing chart for a $P T$ of T\#10ms. Variable abc changes to TRUE as soon as variable $A$ changes to TRUE. Variable abc changes to FALSE 10 ms later.

## Additional Information

- Use the TON instruction (page 2-116) for a timer that starts when In changes to TRUE and then changes the timer output to TRUE when the elapsed time reaches the set time.
- Use the TOF instruction (page 2-120) for a timer that starts when In changes to FALSE and then changes the timer output to FALSE when the elapsed time reaches the set time.

## Precautions for Correct Use

- $E T$ and $Q$ are updated only when the instruction is executed. Therefore, $Q$ does not change to FALSE precisely when the elapsed time from when the timer starts reaches $P T$. $Q$ changes the next time the instruction is executed after the elapsed time from when the timer starts reaches $P T$. The change in $Q$ can therefore occur with a delay of up to one task period.
- Set $P T$ and $E T$ in nanoseconds (ns), but remember the timing accuracy is 100 ns .
- The timer starts as soon as operation starts if $I n$ is already TRUE.
- If T\#Oms or a negative number is set for PT, $Q$ will not change to TRUE even if the value of In changes to TRUE.
- You can change the value of $P T$ while the value of $I n$ is TRUE. Operation is as follows:

| Timer status | Value of $\boldsymbol{Q}$ | Value of $\boldsymbol{P T}$ after it is <br> changed | Operation |
| :--- | :--- | :--- | :--- |
| After comple- <br> tion of timing | FALSE | --- | The value of $Q$ remains FALSE. <br> The value of $E T$ also does not change. (It remains at <br> the value of $P T$ before it was changed.) |
|  |  | $P T \geq E T$ | Timing is continued. When the value of $E T$ reaches <br> the value of $P T$, the value of $Q$ changes to FALSE <br> and $E T$ is no longer incremented. |
| Timing in <br> progress | TRUE |  | $P T<E T$ |
|  |  | The value of $Q$ changes to FALSE immediately. <br> Incrementing $E T$ stops immediately. |  |

- If this instruction is in a master control region and the master control region is reset, timing is continued to the end if the timer is operating. Then, the value of $E T$ changes to 0 and the value of $Q$ changes to FALSE. However, if an Out instruction is connected to $Q$, the execution condition to the Out instruction is FALSE even if the value of $Q$ is TRUE.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of $E T$ is not updated and timing is not performed. Timing restarts when the instruction is executed again.
- If this instruction is used in a ladder diagram, the value of $Q$ changes to FALSE if an error occurs in the previous instruction on the rung.

## AccumulationTimer

The AccumulationTimer instruction totals the time that the timer input is TRUE．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AccumulationTimer | Accumulation Timer | FB |  | AccumulationTimer＿instanc e（In，PT，Reset，Q，ET）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Timer input | Input | TRUE：Timer operates FALSE：Timer stops | Depends on data type． | －－－ | FALSE |

## Function

The AccumulationTimer instruction totals the time that the timer input is TRUE．Set the time in nanosec－ onds（ns）．The timing accuracy is 100 ns ．If reset Reset is FALSE，the timer starts when In changes to TRUE．Total time $E T$ is incremented as time elapses．The timer stops when In changes to FALSE．ET is held．When In changes to TRUE again，the timer starts again．$E T$ is incremented from the value that was previously held．When $E T$ reaches set time $P T$ ，timer output $Q$ changes to TRUE．$E T$ is not incre－ mented after that．The timer is reset when Reset changes to TRUE．
$E T$ changes to 0 and $Q$ changes to FALSE．

The following figure shows a programming example and timing chart for a $P T$ of $\mathrm{T} \# 10 \mathrm{~ms}$. Variable $a b c$ changes to TRUE when variable $A$ is TRUE for a total of 10 ms (i.e., the total time).

## Additional Information

Use the TON instruction (page 2-116) for a timer that resets the timer output and elapsed time when In changes to FALSE.

## Precautions for Correct Use

- $E T$ and $Q$ are updated only when the instruction is executed. Therefore, $Q$ does not change to TRUE precisely when the total time of timer operation reaches $P T$. $Q$ changes the next time the instruction is executed after the total time of timer operation reaches $P T$. The change in $Q$ can therefore occur with a delay of up to one task period.
- Set $P T$ and $E T$ in nanoseconds (ns), but remember the timing accuracy is 100 ns .
- If In and Reset are both TRUE, Reset has priority. That is, ET changes to 0 and $Q$ changes to FALSE.
- The timer starts as soon as operation starts if $I n$ is already TRUE.
- If T\#Oms or a negative number is set for $P T, Q$ will change to TRUE as soon as the value of In changes to TRUE.
- You can change the value of $P T$ before the value of $E T$ reaches the value of $P T$. Operation is as follows:

| Timer status | Value of $\boldsymbol{Q}$ | Value of $\boldsymbol{P T}$ after it is <br> changed | Operation |
| :--- | :--- | :--- | :--- |
| After comple- <br> tion of timing | TRUE | --- | The value of $Q$ remains TRUE. <br> The value of $E T$ also does not change. (It remains at <br> the value of $P T$ before it was changed.) |
|  |  | $P T \geq E T$ | When the value of $I n$ changes to TRUE, timing is <br> continued. When the value of $E T$ reaches the value <br> of $P T$, the value of $Q$ changes to TRUE and $E T$ is no <br> longer incremented. |
| Timing in <br> progress | FALSE | $P T<E T$ | When the value of $I n$ changes to TRUE, the value of <br> $Q$ changes to TRUE immediately. Incrementing $E T$ <br> stops immediately. |
|  |  |  |  |

- If this instruction is in a master control region and the master control region is reset, the operation is as follows:
- The timer stops. The values of $E T$ and $Q$ at that time are retained.
- When the master control reset is cleared, ET is incremented again from the value that was retained.
- If an Out instruction is connected to $Q$, the execution condition to the Out instruction is FALSE even if the value of $Q$ is TRUE.
- Reset is enabled.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of $E T$ is not updated. However, timing still continues. Therefore, $E T$ is updated to the correct value the next time the instruction is executed.
- If this instruction is used in a ladder diagram, the value of $Q$ changes to FALSE if an error occurs in the previous instruction on the rung.

## Timer

The Timer instruction outputs TRUE when the set time elapses after the timer starts. Set the time in increments of 100 ms . The timing accuracy is 100 ms .

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Timer | Hundred-ms Timer | FUN |  | Out:=Timer (In, PT, TimerDat, Q, ET); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Timer input | Input | TRUE: Timer start specification <br> FALSE: Timer reset specification | Depends on data type. | --- | FALSE |
| PT | Set time |  | Time from when timer starts until $Q$ changes to TRUE |  | ms | * |
| TimerDat | Timer status | In-out | Current status of timer | --- | --- | --- |
| Out | Return value | Output | TRUE: Make timer output TRUE <br> FALSE: Make timer output FALSE | Depends on data type. | --- | --- |
| Q | Timer output |  | Same meaning as Out. |  |  |  |
| ET | Remaining time |  | Remaining time |  | ms |  |

* If you omit an input parameter, the default value is not applied. A building error will occur.

## Function

The Timer instruction outputs TRUE when the set time elapses after the timer starts. Set the time in increments of 100 ms . The timing unit is 100 ms .

The timer is reset when timer input In changes to FALSE. Remaining time $E T$ is set to set time $P T$, and timer output $Q$ changes to FALSE.
The timer starts when In changes to TRUE. The value of $E T$ is timed down. When the value of $E T$ reaches 0 , timer output $Q$ changes to TRUE. $E T$ is not timed down after that.
The timer is reset if In changes to FALSE after the timer starts but before ET reaches 0 .
The data type of timer status TimerDat is structure _sTimer.
The following figure shows a programming example and timing chart when PT is UINT\#10. Variable ghi will change to TRUE $1,000 \mathrm{~ms}(1 \mathrm{~s})$ after variable $A$ changes to TRUE.

## Additional Information

For more precise timing, use the TON instruction (page 2-116), which is set in increments of 100 nanoseconds (ns). The TON instruction times in increments of 100 nanoseconds (ns) when the instruction is executed, so it is more precise than the Timer instruction. However, the execution time of the Timer instruction is shorter.

## Precautions for Correct Use

- Timing is performed at the beginning of the POU that contains this instruction. Therefore, the value of $E T$ will be the same regardless of where the instruction is executed in the POU.
- $Q$ is updated when the instruction is executed. Therefore, $Q$ does not change to TRUE precisely when the time that is set with PT elapses after the timer starts. $Q$ changes to TRUE the next time the instruction is executed after the time that is set with $P T$ elapses after the timer starts. The change in $Q$ can therefore occur with a delay of up to one task period.
- Although TimerDat is an in-out variable, it is not necessary to pass any values. Create a memory area for the size of the _sTimer structure and pass it to the instruction.
- Do not change the contents of TimerDat.
- The timer starts as soon as operation starts if $I n$ is already TRUE.
- If the value of $P T$ changes, the new value is used from the next time that the timer is reset. The value is not updated while timing is in progress.
- If this instruction is in a master control region and the master control region is reset, the timer is reset. $E T$ is set to the value of $P T$ and the value of $Q$ changes to FALSE.
- If this instruction is not executed due to the execution of a jump instruction (e.g., the JMP instruction), the value of $E T$ is not updated. However, timing still continues. Therefore, $E T$ is updated to the correct value the next time the instruction is executed.
- If this instruction is used in a ladder diagram, the values of $Q$ and Out change to FALSE if an error occurs in the previous instruction on the rung.

2 Instruction Descriptions

## Counter Instructions

| Instruction | Name | Page |
| :--- | :--- | :--- |
| CTD | Down-counter | $2-134$ |
| CTD_** $^{* *}$ | Down-counter Group | $2-136$ |
| CTU | Up-counter | $2-138$ |
| CTU_** $^{* *}$ | Up-counter Group | $2-140$ |
| CTUD | Up-down Counter | $2-142$ |
| CTUD_** | Up-down Counter Group | $2-146$ |

## CTD

The CTD instruction decrements the counter value when the counter input signal is received．The pre－ set value and counter value must have an INT data type．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CTD | Down－counter | FB |  | CTD＿instance（CD，Load， PV，Q，CV）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CD | Counter input | Input | Counter input | Depends on data type． | －－－ | FALSE |
| Load | Load signal |  | TRUE：Set CV to PV． |  |  |  |
| PV | Preset value |  | Counter preset value | 0 to 32767 |  | 0 |
| Q | Counter output | Output | TRUE：Counter output ON FALSE：Counter output OFF | Depends on data type． | －－－ | －－－ |
| CV | Counter value |  | Counter present value | 0 to 32767 |  |  |

|  | $\begin{aligned} & \text { Do } \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ |  | Bit | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | me | dur | ion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ⿴囗十 O ㅇ | $\begin{aligned} & \text { 䍗 } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 믈 O D | $\sum_{0}^{C}$ O O | ${\underset{\sim}{1}}_{\substack{C}}$ | $\underset{\underset{J}{C}}{\substack{C}}$ | $\underset{\text { 딕 }}{\text { 든 }}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | ${\underset{-1}{\infty}}_{\infty}^{\infty}$ | $\bar{\Sigma}_{1}$ | $\underset{\text { 윽 }}{ }$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \\ & \hline \end{aligned}$ |  | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 另 } \\ & \text { n } \end{aligned}$ | -7 | 먹 | 足 |
| CD | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Load | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| PV |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |
| Q | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| CV |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |

## Function

The CTD instruction creates a down counter．The preset value and counter value must have an INT data type．
When load signal Load changes to TRUE，counter value CV is set to the value of preset value $P V$ and counter output $Q$ changes to FALSE．When counter input signal CD changes to TRUE，CV is decre－ mented．When the value of $C V$ reaches 0 or less，the value of $Q$ changes to TRUE．
After the value of $C V$ reaches 0 or less，$C V$ does not change even if $C D$ changes to TRUE．
$C D$ is ignored while Load is TRUE．CV is not decremented．

The following figure shows a programming example and timing chart for a PV of LINT\#5.

## Additional Information

- Use the CTU instruction (page 2-138) to create a counter that increments the counter value each time the counter input signal is received.
- Use the CTUD instruction (page 2-142) to create a counter that is both incremented and decremented.

## Precautions for Correct Use

- Change Load to TRUE and then back to FALSE to restart a counter that has completed counting down.
- Even when $P V$ is set to a negative value, $C V$ is set to the value of $P V$ when the value of Load changes to TRUE. The value of $C V$ will be 0 or less, so the value of $Q$ changes to TRUE immediately. After that, the value of $C V$ is not decremented even if the value of $C D$ changes.
- If the value of $C D$ is FALSE and the power supply is interrupted or the operating mode is changed to PROGRAM mode, the value of $C V$ is decremented once if the value of $C D$ is TRUE when instruction execution is restarted.
- If this instruction is used in a ladder diagram, the value of $Q$ changes to FALSE if an error occurs in the previous instruction on the rung.

## CTD＿＊＊

The CTD＿＊＊instruction decrements the counter value when the counter input signal is received．The preset value and counter value must be one of the following data types：DINT，LINT，UDINT，or ULINT．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CTD＿＊＊ | Down－counter Group | FB | ＂＊＊＂must be DINT，LINT，UDINT， or ULINT． | CTD＿＊＊＿instance（CD， Load，PV，Q，CV）； ＂＊＊＂must be DINT，LINT， UDINT，or ULINT． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CD | Counter input | Input | Counter input | Depends on data type． | －－－ | FALSE |
| Load | Load signal |  | TRUE：Set CV to PV． |  |  |  |
| PV | Preset value |  | Counter preset value | Depends on data type．＊ |  | 0 |
| Q | Counter output | Output | TRUE：Counter output ON FALSE：Counter output OFF | Depends on data type． | －－－ | －－－ |
| CV | Counter value |  | Counter present value | Depends on data type．＊ |  |  |

＊Negative numbers are excluded．

|  | $\begin{aligned} & \text { O } \\ & \text { o } \\ & \stackrel{0}{\infty} \\ & \end{aligned}$ | Bit string |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ⿴囗十 O 응 | $\begin{aligned} & \text { 䍗 } \\ & \text { n } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & 0 \\ & 0 \end{aligned}$ | 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { 另 } \end{aligned}$ | $\underset{\underset{Z}{6}}{\substack{C}}$ | $\underset{\substack{C}}{\substack{c}}$ | $\frac{C_{2}^{2}}{2}$ | $\underset{\underset{1}{c}}{\underset{1}{C}}$ | $\underset{\sim}{\infty}$ | $\sum_{1}$ | $\underset{\text { 믁 }}{ }$ | $\sum_{\underset{1}{\prime}}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { T } \end{aligned}$ |  | $\begin{gathered} -1-1 \\ \hline \mathbf{3} \end{gathered}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 음 | 머 | 号 |

| Load | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| PV |  |  |  |  |  |  |  | OK | OK |  |  | OK | OK |  |  |  |  |  |  |  |
| Q | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| CV | Must be the same data type as PV |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

A CTD＿＊＊instruction creates a down counter．The preset value and counter value must be one of the following data types：DINT，LINT，UDINT，or ULINT．The name of the instruction is determined by the data type of $P V$ and $C V$ ．For example，if they are the CV data type，the instruction is CTD＿LINT．
When load signal Load changes to TRUE，counter value $C V$ is set to the value of preset value $P V$ and counter output $Q$ changes to FALSE．When counter input signal CD changes to TRUE，$C V$ is decre－ mented．When the value of $C V$ reaches 0 or less，the value of $Q$ changes to TRUE．

After the value of $C V$ reaches 0 or less, $C V$ does not change even if $C D$ changes to TRUE. $C D$ is ignored while Load is TRUE. CV is not decremented.
The following figure shows a CTD_LINT programming example and timing chart for a PV of LINT\#5.

## Additional Information

- Use the CTU instruction (page 2-138) to create a counter that increments the counter value each time the counter input signal is received.
- Use the CTUD instruction (page $2-142$ ) to create a counter that is both incremented and decremented.

## Precautions for Correct Use

- Change Load to TRUE and then back to FALSE to restart a counter that has completed counting down.
- Use the same data type for $P V$ and $C V$.
- Even when $P V$ is set to a negative value, $C V$ is set to the value of $P V$ when the value of Load changes to TRUE. The value of $C V$ will be 0 or less, so the value of $Q$ changes to TRUE immediately. After that, the value of $C V$ is not decremented even if the value of $C D$ changes.
- If the value of $C D$ is FALSE and the power supply is interrupted or the operating mode is changed to PROGRAM mode, the value of $C V$ is decremented once if the value of $C D$ is TRUE when instruction execution is restarted.
- If this instruction is used in a ladder diagram, the value of $Q$ changes to FALSE if an error occurs in the previous instruction on the rung.

## CTU

The CTU instruction increments the counter value when the counter input signal is received. The preset value and counter value must have an INT data type.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CTU | Up-counter | FB |  | CTU_instance (CU, Reset, PV, Q, CV); |

## Variables

| Name | Meaning | 1/0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CU | Counter input | Input | Counter input | Depends on data type. | --- | FALSE |
| Reset | Reset signal |  | TRUE: Reset $C V$ to 0. |  |  |  |
| PV | Preset value |  | Counter preset value | 0 to 32767 |  | 0 |
| Q | Counter output | Output | TRUE: Counter output ON FALSE: Counter output OFF | Depends on data type. | --- | --- |
| CV | Counter value |  | Counter present value | 0 to 32767 |  |  |

## Function

The CTU instruction creates an up counter. The preset value and counter value must have an INT data type.
When reset signal Reset changes to TRUE, counter value $C V$ changes to 0 and counter output $Q$ changes to FALSE. When counter input signal $C U$ changes to TRUE, $C V$ is incremented. When the value of $C V$ reaches the value of $P V$ or higher, the value of $Q$ changes to TRUE.
After the value of $C V$ reaches the value of $P V$ or higher, the value of $C V$ does not change even if the value of $C U$ changes to TRUE.
$C U$ is ignored while Reset is TRUE. CV is not incremented.

The following figure shows a programming example and timing chart for a PV of LINT\#5.

## Additional Information

- Use the CTD instruction (page 2-134) to create a counter that decrements the counter value each time the counter input signal is received.
- Use the CTUD instruction (page $2-142$ ) to create a counter that is both incremented and decremented.

## Precautions for Correct Use

- Change Reset to TRUE and then back to FALSE to restart a counter that has completed counting up.
- Even when $P V$ is set to a negative value, $C V$ is set to 0 when the value of Reset changes to TRUE. The value of $C V$ will be higher than the value of $P V$, so the value of $Q$ changes to TRUE immediately. After that, the value of $C V$ is not incremented even if the value of $C U$ changes.
- The following operation is performed if the value of $P V$ changes while the value of Reset is FALSE.

| Value of $\boldsymbol{P V}$ | Meaning |
| :--- | :--- |
| Larger than the current value of $C V$ | The count operation is continued. |
| Equal to or smaller than the current <br> value of $C V$ | The count operation is ended. The value of $Q$ changes to TRUE. The <br> current value of $C V$ is retained. It does not change. |

- If the value of $C U$ is FALSE and the power supply is interrupted or the operating mode is changed to PROGRAM mode, the value of $C V$ is incremented once if the value of $C U$ is TRUE when instruction execution is restarted.
- If this instruction is used in a ladder diagram, the value of $Q$ changes to FALSE if an error occurs in the previous instruction on the rung.

## CTU＿＊＊

The CTU＿＊＊instruction increments the counter value when the counter input signal is received．The preset value and counter value must be one of the following data types：DINT，LINT，UDINT，or ULINT．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CTU＿＊＊ | Up－counter Group | FB | ＂＊＊＂must be DINT，LINT，UDINT， or ULINT． | CTU＿＊＊＿instance（CU， Reset，PV，Q，CV）； ＂＊＊＂must be DINT，LINT， UDINT，or ULINT． |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CU | Counter input | Input | Counter input | Depends on data type． | －－－ | FALSE |
| Reset | Reset signal |  | TRUE：Reset $C V$ to 0. |  |  |  |
| PV | Preset value |  | Counter preset value | Depends on data type．＊ |  | 0 |
| Q | Counter output | Output | TRUE：Counter output ON FALSE：Counter output OFF | Depends on data type． | －－－ | －－－ |
| CV | Counter value |  | Counter present value | Depends on data type．＊ |  |  |

＊Negative numbers are excluded．

| CU | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Reset | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| PV |  |  |  |  |  |  |  | OK | OK |  |  | OK | OK |  |  |  |  |  |  |  |
| Q | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| CV |  |  |  |  |  |  |  | Must b | e the | same | data | type | as $P$ |  |  |  |  |  |  |  |

## Function

A CTU＿＊＊instruction creates an up counter．The preset value and counter value must be one of the fol－ lowing data types：DINT，LINT，UDINT，or ULINT．The name of the instruction is determined by the data type of $P V$ and $C V$ ．For example，if they are the LINT data type，the instruction is CTU＿LINT．
When reset signal Reset changes to TRUE，counter value $C V$ changes to 0 and counter output $Q$ changes to FALSE．When counter input signal CU changes to TRUE，CV is incremented．When the value of $C V$ reaches the value of $P V$ or higher，the value of $Q$ changes to TRUE．

After the value of $C V$ reaches the value of $P V$ or higher, the value of $C V$ does not change even if the value of $C U$ changes to TRUE.
$C U$ is ignored while Reset is TRUE. CV is not incremented.
The following figure shows a CTU_LINT programming example and timing chart for a PV of LINT\#5.
LD

ST
CTU_LINT_instance(A, abc, LINT\#5, def, ghi);

## Additional Information

- Use the CTD instruction (page 2-134) to create a counter that decrements the counter value each time the counter input signal is received.
- Use the CTUD instruction (page $2-142$ ) to create a counter that is both incremented and decremented.

## Precautions for Correct Use

- Change Reset to TRUE and then back to FALSE to restart a counter that has completed counting up.
- Even when $P V$ is set to a negative value, $C V$ is set to 0 when the value of Reset changes to TRUE. The value of $C V$ will be higher than the value of $P V$, so the value of $Q$ changes to TRUE immediately. After that, the value of $C V$ is not incremented even if the value of $C U$ changes.
- Use the same data type for $P V$ and $C V$.
- The following operation is performed if the value of $P V$ changes while the value of Reset is FALSE.

| Value of $\boldsymbol{P V}$ | Meaning |
| :--- | :--- |
| Larger than the current value of $C V$ | The count operation is continued. |
| Equal to or smaller than the current | The count operation is ended. The value of $Q$ changes to TRUE. The <br> current value of $C V$ is retained. It does not change. |

- If the value of $C U$ is FALSE and the power supply is interrupted or the operating mode is changed to PROGRAM mode, the value of $C V$ is incremented once if the value of $C U$ is TRUE when instruction execution is restarted.
- If this instruction is used in a ladder diagram, the value of $Q$ changes to FALSE if an error occurs in the previous instruction on the rung.

## CTUD

The CTUD instruction creates an up-down counter that operates according to an up-counter input and a down-counter input. The preset value and counter value must have an INT data type.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CTUD | Up-down Counter | FB |  | CTUD_instance (CU, CD, Reset, Load, PV, QU, QD, CV ); |

## Function

The CTUD instruction creates an up－down counter that operates according to an up－counter input sig－ nal and a down－counter input signal．It has the functions of both an up counter and a down counter．The preset value and counter value must have an INT data type．

## Operation as an Up Counter

When reset signal Reset changes to TRUE，counter value $C V$ changes to 0 and up－counter output $Q U$ changes to FALSE．When up－counter input signal $C U$ changes to TRUE，$C V$ is incremented．When the value of $C V$ reaches the value of $P V$ or higher，the value of $Q U$ changes to TRUE．After the value of $C V$ reaches the value of $P V$ or higher，the value of $C V$ does not change even if the value of $C U$ changes to TRUE．

## Operation as a Down Counter

When load signal Load changes to TRUE，counter value $C V$ changes to the value of preset value $P V$ and down－counter output $Q D$ changes to FALSE．When down－counter input signal $C D$ changes to TRUE，$C V$ is decremented．When the value of $C V$ reaches 0 or less，the value of $Q D$ changes to TRUE． After the value of $C V$ reaches 0 or less，$C V$ does not change even if $C D$ changes to TRUE．

## Common Operation for Up and Down Counters

$C U$ and $C D$ are ignored while Load and Reset are TRUE．CV is not incremented or decremented．If both $C U$ and $C D$ change to TRUE at the same time，CV will not change．If Reset and Load are both TRUE，Reset has priority and the value of $C V$ changes to 0 ．If Reset changes to TRUE，$C V$ changes to 0 ，and so $Q D$ changes to TRUE．If Load changes to TRUE，the value of $C V$ changes to $P V$ ，and so $Q U$ changes to TRUE．

The following table shows the relationship between Reset, Load, $C V, Q U$, and $Q D$. This assumes that the value of $P V$ is larger than 0 .

| Reset | Load | CV | QU | QD | Operation |
| :---: | :---: | :---: | :---: | :---: | :---: |
| FALSE | FALSE | 0 or lower | FALSE | TRUE | Only up counter operation is performed. <br> - $C V$ is incremented when $C U$ changes to TRUE. It is not decremented when $C D$ changes to TRUE. |
|  |  | Between <br> 0 and $P V$ | FALSE | FALSE | Both up and down counter operation is performed. <br> - $C V$ is incremented when $C U$ changes to TRUE and decremented when $C D$ changes to TRUE. |
|  |  | PV or higher | TRUE | FALSE | Only down counter operation is performed. <br> - $C V$ is decremented when $C D$ changes to TRUE. It is not incremented when $C U$ changes to TRUE. |
| TRUE | FALSE | 0 | FALSE | TRUE | The up counter is reset. <br> - The value of $C V$ is set to 0 . |
| FALSE | TRUE | PV | TRUE | FALSE | The down counter is reset. <br> - The value of $C V$ is set to $P V$. |
| TRUE | TRUE | 0 | FALSE | TRUE | The up counter is reset. Reset take priority over Load. <br> - The value of $C V$ is set to 0 . |

The following figure shows a programming example and timing chart for a PV of INT\#3.

## LD

ST

CTUD_instance(A, B, abc, def, INT\#3, ghi, jkl, mno);

## Additional Information

Use the CTD instruction (page 2-134) or CTU instruction (page 2-138) to create a counter that only decrements or only increments.

## Precautions for Correct Use

- If you change Reset to TRUE to reset the up-counter operation, $Q U$ will change to FALSE and $Q D$ will change to TRUE.
- If you change Load to TRUE to reset the down-counter operation, $Q D$ will change to FALSE and $Q U$ will change to TRUE.
- Even when $P V$ is set to a negative value, $C V$ is set to the value of $P V$ when the value of Load changes to TRUE. The value of $C V$ will be 0 or less, so the value of $Q D$ changes to TRUE immediately. After that, the value of $C V$ is not decremented even if the value of $C D$ changes. When the value of Reset changes to TRUE, the value of $C V$ changes to 0 . The value of $C V$ will be the value of $P V$ or higher, so the value of $Q U$ changes to TRUE immediately. After that, the value of $C V$ is not incremented even if the value of $C U$ changes.
- You can change the value of $P V$ during execution of the instruction. If the new value of $P V$ is less than the current value of $C V$, the value of $Q U$ changes to TRUE immediately.
- If the value of $C U$ or $C D$ is FALSE and the power supply is interrupted or the operating mode is changed to PROGRAM mode, the value of $C V$ is incremented or decremented once if the value of $C U$ or $C D$ is TRUE when instruction execution is restarted.

## CTUD

The CTUD_** instruction creates an up-down counter that operates according to an up-counter input and a down-counter input. The preset value and counter value must be one of the following data types: DINT, LINT, UDINT, or ULINT.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CTUD_** | Up-down Counter Group | FB |  | CTUD_**_instance (CU, CD, Reset, Load, PV, QU, QD, CV); "**" must be DINT, LINT, UDINT, or ULINT. |

## Variables

| CV | Must be the same data type as PV |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

A CTUD＿＊＊instruction creates an up－down counter that operates according to an up－counter input sig－ nal and a down－counter input signal．The counter has the functions of both an up counter and a down counter．The preset value and counter value must be one of the following data types：DINT，LINT， UDINT，or ULINT．The name of the instruction is determined by the data type of $P V$ and $C V$ ．For exam－ ple，if they are the LINT data type，the instruction is CTUD＿LINT．

## Operation as an Up Counter

When reset signal Reset changes to TRUE，counter value $C V$ changes to 0 and up－counter output $Q U$ changes to FALSE．When up－counter input signal $C U$ changes to TRUE，CV is incremented．When the value of $C V$ reaches the value of $P V$ or higher，the value of $Q U$ changes to TRUE．After the value of $C V$ reaches the value of $P V$ or higher，the value of $C V$ does not change even if the value of $C U$ changes to TRUE．

## Operation as a Down Counter

When load signal Load changes to TRUE，counter value $C V$ changes to the value of preset value $P V$ and down－counter output $Q D$ changes to FALSE．When down－counter input signal $C D$ changes to TRUE，$C V$ is decremented．When the value of $C V$ reaches 0 or less，the value of $Q D$ changes to TRUE． After the value of $C V$ reaches 0 or less，$C V$ does not change even if $C D$ changes to TRUE．

## Common Operation for Up and Down Counters

$C U$ and $C D$ are ignored while Load or Reset is TRUE．CV is not incremented or decremented．If both $C U$ and $C D$ change to TRUE at the same time，$C V$ will not change．If Reset and Load are both TRUE， Reset has priority and the value of CV changes to 0 ．If Reset changes to TRUE，CV changes to 0 ，and so $Q D$ changes to TRUE．If Load changes to TRUE，the value of $C V$ changes to $P V$ ，and so $Q U$ changes to TRUE．

The following table shows the relationship between Reset, Load, $C V, Q U$, and $Q D$. This assumes that the value of $P V$ is larger than 0 .

| Reset | Load | CV | QU | QD | Operation |
| :---: | :---: | :---: | :---: | :---: | :---: |
| FALSE | FALSE | 0 or lower | FALSE | TRUE | Only up counter operation is performed. <br> - $C V$ is incremented when $C U$ changes to TRUE. It is not decremented when $C D$ changes to TRUE. |
|  |  | Between <br> 0 and $P V$ | FALSE | FALSE | Both up and down counter operation is performed. <br> - $C V$ is incremented when $C U$ changes to TRUE and decremented when $C D$ changes to TRUE. |
|  |  | PV or higher | TRUE | FALSE | Only down counter operation is performed. <br> - $C V$ is decremented when $C D$ changes to TRUE. It is not incremented when $C U$ changes to TRUE. |
| TRUE | FALSE | 0 | FALSE | TRUE | The up counter is reset. <br> - The value of $C V$ is set to 0 . |
| FALSE | TRUE | PV | TRUE | FALSE | The down counter is reset. <br> - The value of $C V$ is set to $P V$. |
| TRUE | TRUE | 0 | FALSE | TRUE | The up counter is reset. Reset take priority over Load. <br> - The value of $C V$ is set to 0 . |

The following figure shows a CTUD_LINT programming example and timing chart for a PV of LINT\#3.

LD

ST

CTUD_LINT_instance(A, B, abc, def, LINT\#3, ghi, jkl, mno);

## Additional Information

Use the CTD instruction (page 2-134) or CTU instruction (page 2-138) to create a counter that only decrements or only increments.

## Precautions for Correct Use

- If you change Reset to TRUE to reset the up-counter operation, $Q U$ will change to FALSE and $Q D$ will change to TRUE.
- If you change Load to TRUE to reset the down-counter operation, $Q D$ will change to FALSE and $Q U$ will change to TRUE.
- Even when $P V$ is set to a negative value, $C V$ is set to the value of $P V$ when the value of Load changes to TRUE. The value of $C V$ will be 0 or less, so the value of $Q D$ changes to TRUE immediately. After that, the value of $C V$ is not decremented even if the value of $C D$ changes. When the value of Reset changes to TRUE, the value of $C V$ changes to 0 . The value of $C V$ will be the value of $P V$ or higher, so the value of $Q U$ changes to TRUE immediately. After that, the value of $C V$ is not incremented even if the value of $C U$ changes.
- You can change the value of $P V$ during execution of the instruction. If the new value of $P V$ is less than the current value of $C V$, the value of $Q U$ changes to TRUE immediately.
- Use the same data type for $P V$ and $C V$.
- If the value of $C U$ or $C D$ is FALSE and the power supply is interrupted or the operating mode is changed to PROGRAM mode, the value of $C V$ is incremented or decremented once if the value of $C U$ or $C D$ is TRUE when instruction execution is restarted.

## Math Instructions

| Instruction | Name | Page | Instruction | Name | Page |

| LN and LOG | Natural Logarithm/ Logarithm Base 10 | 2-182 |  |  |  |

## ADD（＋）

The ADD（＋）instruction adds integers or real numbers．It also joins text strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ADD（＋） | Addition | FUN |  | Out：＝In1＋$\cdots+\operatorname{lnN}$ ； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| In1 to InN | Add values | Input | Numbers to add，N＝2 to 5 | Depends on data type． | --- | $0^{*}$ |
| Out | Addition <br> result | Output | Addition result | Depends on data type． | --- |  |

＊If you omit the input parameter that connects to $I n N$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\ln 1$ and $\ln 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

|  | $\begin{aligned} & \text { © } \\ & \text { o } \\ & \underline{0} \\ & \text { Oj } \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 置 } \\ & \end{aligned}$ | $\begin{aligned} & \text { 䍗 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { 品 } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O} \\ & \hline 0 \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\substack{\mathrm{Z}}}{\text { ᄃ }}$ |  | $\frac{\underset{i}{C}}{\underset{\lambda}{2}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{2}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{\mathbb{2}} \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \text { 罦 } \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | -1 | 먹 |  |
| In1 to InN |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  | OK |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  | OK |

## Function

The ADD（＋）instruction adds between two and five integers or real numbers．The data types of add val－ ues $\operatorname{In} 1$ to $\operatorname{InN}$ and addition result Out can have different data types．
The following example is for when $\ln 1$ is INT\＃10，In2 is INT\＃20 and $\operatorname{In} 3$ is INT\＃30．The value of variable $a b c$ will be INT\＃60．

If $\operatorname{In} 1$ to $\operatorname{In} N$ are STRING data, the text strings are joined. However, if $\operatorname{In} 1$ to $\operatorname{In} N$ are STRING data, you must use the instruction in a ladder diagram.
The following example is for when $\operatorname{In} 1$ is UV, $\operatorname{In} 2$ is WX and $\operatorname{In} 3$ is YZ . The value of variable abc will be UVWXYZ.

The functions of the ADD instruction and the + instruction are exactly the same. Use the form that is easier to use.

## Additional Information

- When you calculate real numbers, use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.
- Use the CONCAT instruction (page 2-520) to join text strings in structured text.

## Precautions for Correct Use

- When you add numbers, set the data type of Out to include the valid ranges of $\ln 1$ to $\ln N$.
- If $\operatorname{In} 1$ to $\operatorname{InN}$ and Out are integers, make sure the addition result will fit in the valid range of Out. Otherwise, the value of Out will be an illegal value. An error will not occur.
- If any of $\ln 1$ to $\operatorname{In} N$ is a real number and the addition result will not fit in the valid range of Out, the value of Out will be positive or negative infinity.
- When you join text strings, use STRING data for In1 to InN and Out.
- The results for overflows in addition are different for ladder diagrams and ST. In a ladder diagram, the calculation is performed within the range of the data type of the input variables. In ST, the precision of the numbers is increased to perform the calculation.
- Addition results of positive or negative infinity are handled as follows for real number values.

| Addition | Addition result |
| :--- | :--- |
| $+\infty$ plus number | $+\infty$ |
| $-\infty$ plus number | $-\infty$ |
| $+\infty$ plus $+\infty$ | $+\infty$ |
| $-\infty$ plus $-\infty$ | $-\infty$ |
| $+\infty$ plus $-\infty$ | Nonnumeric <br> data |

- If any of the values of $\operatorname{In} 1$ to $\operatorname{In} N$ is nonnumeric data, the value of Out is nonnumeric data.
- You can add real numbers and integers. If you do, Out is a real number.
- An error will occur in the following cases. ENO will be FALSE, and Out will not change.
- One of $\operatorname{In} 1$ to $\operatorname{InN}$ does not end in the NULL character when joining strings.
- The size of the joined text string exceeds the valid range of Out when joining strings.

## AddOU（＋OU）

The AddOU（＋OU）instruction adds integers and real numbers．It also performs an overflow／underflow check．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AddOU（＋OU） | Addition with Over－ flow／Underflow Check | FUN |  | Out：＝AddOU（In1，$\cdots$ ，InN）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to InN | Add values | Input | Numbers to add， $\mathrm{N}=2$ to 5 | Depends on data type． | --- | $0^{*}$ |
| Out | Addition <br> result | Output | Addition result | Depends on data type． | --- |  |

＊If you omit the input parameter that connects to $\operatorname{InN}$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\operatorname{In} 1$ and $\operatorname{In} 2$ are omitted，the default values are applied，but if the input parameter that connects to In3 is omitted，a building error will occur．

|  | $\begin{aligned} & \text { © } \\ & \stackrel{0}{0} \\ & \stackrel{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  | $\begin{aligned} & \text { J } \\ & \frac{1}{3} \\ & \stackrel{0}{0} \\ & \frac{0}{\omega} \\ & \stackrel{N}{\omega} \end{aligned}$ |  | Times，durations， dates，and text strings |  |  |  |  |

| In1 to InN |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The AddOU（＋OU）instruction adds between two and five integers or real numbers and outputs the result．The data types of add values $\operatorname{In} 1$ to $\operatorname{InN}$ and addition result Out can have different data types．If the addition result exceeds the valid range of the data type that includes all of the data types of $\ln 1$ to InN，the value of the $P_{-} C Y$ system－defined variable（Carry Flag）changes to TRUE．This indicates that an overflow or an underflow has occurred．
If Out is a real number and an overflow or underflow occurs，the value of Out is positive or negative infinity．If Out is an integer，only the bits of the addition result that fit in the data type of Out are assigned to Out．
The following example is for when In1 is INT\＃32767，In2 is INT\＃1 and variable abc has an INT data type．The addition result（32768）exceeds the valid range of INT data，so the value of P＿CY changes to TRUE．The value of variable $a b c$ will be INT\＃－32768（the lower 16 bits of 32768 ）．

The functions of the AddOU instruction and the +OU instruction are exactly the same. Use the form that is easier to use.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| P_CY | Carry (CY) Flag | BOOL | TRUE: There is an overflow or underflow. <br> FALSE: There is no overflow or underflow. |

## Additional Information

- When you calculate real numbers, use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.
- Use the ADD (+) instruction (page 2-152) if there is no need for an overflow/underflow check. It will reduce processing time.

## Precautions for Correct Use

- Set the data type of Out to include the valid ranges of $\operatorname{In} 1$ to $\operatorname{In} N$.
- If In1 to InN and Out are integers, make sure the addition result will fit in the valid range of Out. Otherwise, the value of Out will be an illegal value. An error will not occur.
- If the data types of $\operatorname{In} 1$ to $\operatorname{InN}$ are different, calculations and processing of $P_{-} C Y$ are performed with the data type that includes all of the data types of $\operatorname{In} 1$ to $\operatorname{InN}$. For example, if $\operatorname{In} 1$ is INT data and $\operatorname{In} 2$ is DINT data, calculations and $P_{-} C Y$ processing are performed with DINT data.
- If In1 to InN contains real data, the value of $P_{-} C Y$ does not change.
- Addition results of positive or negative infinity are handled as follows for real number values.

| Addition | Addition result |
| :--- | :--- |
| $+\infty$ plus number | $+\infty$ |
| $-\infty$ plus number | $-\infty$ |
| $+\infty$ plus $+\infty$ | $+\infty$ |
| $-\infty$ plus $-\infty$ | $-\infty$ |
| $+\infty$ plus $-\infty$ | Nonnumeric <br> data |

- If any of the values of $\operatorname{In} 1$ to $\operatorname{In} N$ is nonnumeric data, the value of Out is nonnumeric data.
- If the value of Out is positive infinity, negative infinity, or nonnumeric data, the value of $P_{-} C Y$ does not change.
- You can add real numbers and integers. If you do, Out is a real number.

## SUB（－）

The SUB（－）instruction subtracts integers and real numbers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SUB（－） | Subtraction | FUN |  | Out：＝ $\ln 1-\ln 2$ ； |

## Variables

| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The SUB（－）instruction subtracts subtrahend In2 from minuend $\operatorname{In} 1$ and outputs the result．The data types of $\operatorname{In} 1, \ln 2$ ，and subtraction result Out can have different data types．
The following example is for when $\operatorname{In} 1$ is INT\＃50 and In2 is INT\＃10．The value of variable abc will be INT\＃40．
LD

ST
abc：＝INT\＃50－INT\＃10；

The functions of the SUB instruction and the－instruction are exactly the same．Use the form that is easier to use．

## Additional Information

When you calculate real numbers, use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.

## Precautions for Correct Use

- Set the data type of Out to include the valid ranges of $\ln 1$ and $\operatorname{In} 2$.
- If $\ln 1, \ln 2$, and Out are integers, make sure the subtraction result will fit in the valid range of Out. Otherwise, the value of Out will be an illegal value. An error will not occur.
- If either $\ln 1$ or $\operatorname{In} 2$ is a real number and the addition result will not fit in the valid range of Out, the value of Out will be positive or negative infinity.
- The results for underflows in subtraction are different for ladder diagrams and ST. In a ladder diagram, the calculation is performed within the range of the data type of the input variables. In ST, the precision of the numbers is increased to perform the calculation.
- Subtraction results of positive or negative infinity are handled as follows for real number values.

| Subtraction | Subtraction <br> result |
| :--- | :--- |
| $+\infty$ minus number | $+\infty$ |
| Number minus $+\infty$ | $-\infty$ |
| $-\infty$ minus number | $-\infty$ |
| Number minus $-\infty$ | $+\infty$ |
| $+\infty$ minus $+\infty$ | Nonnumeric <br> data |
| $+\infty$ minus $-\infty$ | $+\infty$ |
| $-\infty$ minus $+\infty$ | $-\infty$ |
| $-\infty$ minus $-\infty$ | Nonnumeric <br> data |

- If any of the values of $\ln 1$ to $\operatorname{In} N$ is nonnumeric data, the value of Out is nonnumeric data.
- You can subtract a real number from an integer or an integer from a real number. If you do, Out is a real number.

## SubOU（－OU）

The SubOU（－OU）instruction subtracts integers or real numbers．It also performs an overflow／underflow check．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SubOU（－OU） | Subtraction with Overflow／Under－ flow Check | FUN |  | Out：＝SubOU（ln1，In2）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\ln 1$ | Minuend | Input | Minuend | Depends on data type． | -- | $0^{*}$ |
| $\ln 2$ |  |  |  | Subtrahend | Depends on data type． |  |
| Out | Subtrac－ <br> tion result | Output | Subtraction result |  |  |  |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  |  |  | Bit st | ings |  |  |  |  | Inte | gers |  |  |  |  |  |  |  | dura |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | \％ | $\underset{\substack{\text { m } \\ \underset{\sim}{n}}}{ }$ | $\sum$ 임 | 응 | $\begin{aligned} & \text { 否 } \\ & \text { 宕 } \end{aligned}$ | $\underset{\substack{\text { © }}}{\substack{0}}$ | $\sum_{-1}^{C}$ | ${\underset{z}{2}}_{\substack{C}}$ | $\sum_{\underset{1}{c}}^{\substack{c}}$ | $\sum_{1}^{\infty}$ | $\underset{1}{2}$ | $\sum_{1}^{0}$ | $\sum_{1}$ | $\begin{aligned} & \underset{\sim}{D} \\ & \stackrel{\pi}{\gtrless} \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \$ \\ & \$ \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 号 } \\ & \text { m } \end{aligned}$ | 음 | 각 | 足 |
| In1 |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In2 |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The SubOU（－OU）instruction subtracts subtrahend $\operatorname{In} 2$ from minuend $\operatorname{In} 1$ and outputs the result．The data types of In1，In2，and subtraction result Out can have different data types．If the subtraction result exceeds the valid range of the data type that includes the data types of $\ln 1$ and $\operatorname{In} 2$ ，the value of the $P_{-} C Y$ system－defined variable（Carry Flag）changes to TRUE．This indicates that an overflow or an underflow has occurred．
If Out is a real number and an overflow or underflow occurs，the value of Out is positive or negative infinity．If Out is an integer，only the bits of the subtraction result that fit in the data type of Out are assigned to Out．

The following example is for when $\operatorname{In} 1$ is SINT\#-128, In2 is SINT\#1 and variable abc has an SINT data type. The subtraction result (-129) exceeds the valid range of SINT data, so the value of P_CY changes to TRUE. The value of variable abc will be SINT\#127 (the lower 8 bits of -129 ).

The functions of the SubOU instruction and the -OU instruction are exactly the same. Use the form that is easier to use.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| P_CY | Carry (CY) Flag | BOOL | TRUE: There is an overflow or underflow. <br> FALSE: There is no overflow or underflow. |

## Additional Information

- When you calculate real numbers, use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.
- Use the SUB (-) instruction (page 2-156) if there is no need for an overflow/underflow check. It will reduce processing time.

## Precautions for Correct Use

- Set the data type of Out to include the valid ranges of $\ln 1$ and $\operatorname{In} 2$.
- If $\operatorname{In} 1, \operatorname{In} 2$, and Out are integers, make sure the subtraction result will fit in the valid range of Out. Otherwise, the value of Out will be an illegal value. An error will not occur.
- If the data types of $\operatorname{In} 1$ and $\operatorname{In} 2$ are different, calculations and processing of $P_{-} C Y$ are performed with the data type that includes the data types of $\operatorname{In} 1$ and $\operatorname{In} 2$. For example, if $\operatorname{In} \overline{1}$ is INT data and $\operatorname{In} 2$ is DINT data, calculations and $P_{-} C Y$ processing are performed with DINT data.
- If In1 or In2 contains real data, the value of $P_{-} C Y$ does not change.
- Subtraction results of positive or negative infinity are handled as follows for real number values.

| Subtraction | Subtraction result |
| :--- | :--- |
| $+\infty$ minus number | $+\infty$ |
| Number minus $+\infty$ | $-\infty$ |
| $-\infty$ minus number | $-\infty$ |
| Number minus $-\infty$ | $+\infty$ |
| $+\infty$ minus $+\infty$ | Nonnumeric data |
| $+\infty$ minus $-\infty$ | $+\infty$ |
| $-\infty$ minus $+\infty$ | $-\infty$ |
| $-\infty$ minus $-\infty$ | Nonnumeric data |

- If the value of either $\ln 1$ or $\ln 2$ is nonnumeric data, the value of Out is nonnumeric data.
- If the value of Out is positive infinity, negative infinity, or nonnumeric data, the value of $P_{-} C Y$ does not change.
- You can subtract a real number from an integer or an integer from a real number. If you do, Out is a real number.

## MUL（＊）

The MUL（＊）instruction multiplies integers and real numbers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MUL（＊） | Multiplication | FUN |  | Out：＝In1＊．．．＊InN； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to $\operatorname{lnN}$ | Values to <br> multiply | Input | Numbers to multiply， $\mathrm{N}=2$ <br> to 5 | Depends on data type． | --- | $1^{*}$ |
| Out | Multiplica－ <br> tion result | Output | Multiplication result | Depends on data type． | --- | --- |

＊If you omit the input parameter that connects to $\operatorname{InN}$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\ln 1$ and $\ln 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

|  |  |  | t | ing |  |  |  |  | Int | ers |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \text { s, a } \end{aligned}$ |  | stion |  |

|  | O | $\begin{aligned} & \text { 罣 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { O} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\frac{C}{\mathbb{N}}$ | $\underset{\substack{\mathrm{Z}}}{\substack{ \\\hline}}$ | ${ }_{3}^{\text {을 }}$ | $\frac{\mathrm{C}}{\underset{i}{2}}$ | ${\underset{-1}{\infty}}_{\infty}^{\infty}$ | $\underset{1}{\underline{1}}$ | ${\underset{Z}{2}}_{\text {인 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{N}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 䍚 } \end{aligned}$ | $\begin{aligned} & \text { 글 } \\ & \frac{1}{n} \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \text { m } \end{aligned}$ | 금 | 막 | O $\frac{10}{2}$ 0 |
| In1 to $\operatorname{lnN}$ |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The MUL（＊）instruction multiplies between two and five integers and real numbers and outputs the result．The data types of values to multiply $\operatorname{In} 1$ to $\operatorname{In} N$ and multiplication result Out can have different data types．
The following example is for when $\operatorname{In} 1$ is INT\＃10， $\operatorname{In} 2$ is INT\＃20 and $\operatorname{In} 3$ is INT\＃30．The value of variable $a b c$ will be INT\＃6000．

LD

ST
abc:=INT\#10*INT\#20*INT\#30;

The functions of the MUL instruction and the * instruction are exactly the same. Use the form that is easier to use.

## Additional Information

When you calculate real numbers, use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.

## Precautions for Correct Use

- Set the data type of Out to include the valid ranges of $\operatorname{In} 1$ to $\operatorname{InN}$.
- If $\operatorname{In} 1$ to $\operatorname{InN}$ and Out are integers, make sure the multiplication result will fit in the valid range of Out. Otherwise, the value of Out will be an illegal value. An error will not occur.
- If any of $\operatorname{In} 1$ to $\operatorname{InN}$ is a real number and the multiplication result will not fit in the valid range of Out, the value of Out will be positive or negative infinity.
- The results for overflows in multiplication are different for ladder diagrams and ST. In a ladder diagram, the calculation is performed within the range of the data type of the input variables. In ST, the precision of the numbers is increased to perform the calculation.
- Multiplication results of positive or negative infinity are handled as follows for real number values.

| Multiplication | Multiplication result |
| :--- | :--- |
| $+\infty$ times positive number | $+\infty$ |
| $+\infty$ times negative number | $-\infty$ |
| $-\infty$ times positive number | $-\infty$ |
| $-\infty$ times negative number | $+\infty$ |
| $+\infty$ times $+\infty$ | $+\infty$ |
| $-\infty$ times $-\infty$ | $+\infty$ |
| $+\infty$ times $-\infty$ | $-\infty$ |
| $+\infty$ times 0 | Nonnumeric data |
| $-\infty$ times 0 | Nonnumeric data |

- If any of the values of $\operatorname{In} 1$ to $\operatorname{In} N$ is nonnumeric data, the value of Out is nonnumeric data.
- You can multiply real numbers and integers. If you do, Out is a real number.

## MuIOU（＊OU）

The MulOU（＊OU）instruction multiplies integers and real numbers and outputs the result．It also per－ forms an overflow／underflow check．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MulOU（＊OU） | Multiplication with Overflow／Under－ flow Check | FUN |  | Out：＝MulOU（ln1，$\cdots, \operatorname{lnN})$ ； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to $\operatorname{lnN}$ | Values to <br> multiply | Input | Numbers to multiply， $\mathrm{N}=2$ <br> to 5 | Depends on data type． | --- | $1^{*}$ |
| Out | Multiplica－ <br> tion result | Output | Multiplication result | Depends on data type． | --- | --- |

＊If you omit the input parameter that connects to $\operatorname{In} N$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\ln 1$ and $\ln 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

|  | O <br> 0 <br> $\frac{0}{0}$ <br>  | Bit string |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { ロ } \\ & \text { 군 } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 0 0 0 0 0 | 「 O D | ${\underset{Z}{2}}_{\substack{C}}$ | $\underset{\underset{\sim}{C}}{C}$ | ${ }_{\frac{0}{3}}^{\text {둑 }}$ | $\begin{aligned} & \stackrel{\Gamma}{\underset{1}{c}} \end{aligned}$ | ${\underset{-1}{\infty}}_{\infty}^{\infty}$ | $\sum_{1}$ | $\underset{\sim}{\text { 윽 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 䍗 } \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 号 } \\ & \text { 翤 } \end{aligned}$ | －1 | 먹 |  |
| ln 1 to InN |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The MuIOU（＊OU）instruction multiplies between two and five integers and real numbers and outputs the result．The data types of values to multiply $\ln 1$ to $\operatorname{InN}$ and multiplication result Out can have different data types．If the multiplication result exceeds the valid range of the data type that includes all of the data types of $\operatorname{In1}$ to $I n N$ ，the value of the $P_{-} C Y$ system－defined variable（Carry Flag）changes to TRUE． This indicates that an overflow or an underflow has occurred．
If Out is a real number and an overflow or underflow occurs，the value of Out is positive or negative infinity．If Out is an integer，only the bits of the multiplication result that fit in the data type of Out are assigned to Out．

The following example is for when In1 is INT\#20000, In2 is INT\#2 and variable abc has an INT data type. The multiplication result (40000) exceeds the valid range of INT data, so the value of P_CY changes to TRUE. The value of variable $a b c$ will be INT\#-25536 (the lower 16 bits of 40000 ).

LD

ST
abc:=MulOU(INT\#20000, INT\#2);

The functions of the MulOU instruction and the *OU instruction are exactly the same. Use the form that is easier to use.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| P_CY | Carry (CY) Flag | BOOL | TRUE: There is an overflow or underflow. <br> FALSE: There is no overflow or underflow. |

## Additional Information

Use the MUL (*) instruction (page 2-161) if there is no need for an overflow/underflow check. It will reduce processing time.

## Precautions for Correct Use

- Set the data type of Out to include the valid ranges of $\ln 1$ to $\ln N$.
- If $\operatorname{In} 1$ to $\operatorname{InN}$ and Out are integers, make sure the multiplication result will fit in the valid range of Out. Otherwise, the value of Out will be an illegal value. An error will not occur.
- If the data types of $\operatorname{In} 1$ to $\operatorname{In} N$ are different, calculations and processing of $P_{-} C Y$ are performed with the data type that includes all of the data types of $\ln 1$ to $\ln N$. For example, if $\operatorname{In} 1$ is INT data and $\operatorname{In} 2$ is DINT data, calculations and $P$ _CY processing are performed with DINT data.
- If In1 to InN contains real data, the value of $P_{-} C Y$ does not change.
- Multiplication results of positive or negative infinity are handled as follows for real number values.

| Multiplication | Multiplication <br> result |
| :--- | :--- |
| $+\infty$ times positive number | $+\infty$ |
| $+\infty$ times negative number | $-\infty$ |
| $-\infty$ times positive number | $-\infty$ |
| $-\infty$ times negative number | $+\infty$ |
| $+\infty$ times $+\infty$ | $+\infty$ |
| $-\infty$ times $-\infty$ | $+\infty$ |
| $+\infty$ times $-\infty$ | $-\infty$ |
| $+\infty$ times 0 | Nonnumeric <br> data |
| $-\infty$ times 0 | Nonnumeric <br> data |

- If the value of Out is positive infinity, negative infinity, or nonnumeric data, the value of $P_{-} C Y$ does not change.
- You can multiply real numbers and integers. If you do, Out is a real number.

## DIV（／）

The DIV（／）instruction divides integers or real numbers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DIV（／） | Division | FUN |  | Out：＝ln1／In2； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\ln 1$ | Dividend | Input | Dividend | Depends on data type． | -- | $*$ |
| $\ln 2$ |  |  |  | Divisor | Depends on data type． | --- |
| Out | Division <br> result | Output | Division result |  |  |  |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  | O | $\begin{aligned} & \text { 箵 } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{2}}_{\substack{C}}^{\text {N }}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\frac{0_{3}^{\prime}}{1}$ | $\underset{\underset{1}{c}}{\stackrel{C}{c}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\sum_{1}$ | $\underset{\text { 은 }}{ }$ | $\sum_{\underset{i}{\prime}}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { 范 } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 罗 } \end{aligned}$ | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 몰 } \\ & \text { n } \end{aligned}$ | 음 | 먹 | － |
| In1 |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In2 |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The DIV（／）instruction divides dividend In1 by divisor In2 and outputs the result．The data types of In1， $\operatorname{In} 2$ ，and division result Out can have different data types．If $\operatorname{In} 1, \operatorname{In} 2$ ，and Out are integers and there is a remainder，the remainder is truncated．
The following example is for when $\operatorname{In} 1$ is INT\＃100 and $\operatorname{In} 2$ is INT\＃5．The value of variable abc will be INT\＃20．

The functions of the DIV instruction and the / instruction are exactly the same. Use the form that is easier to use.

## Additional Information

When you calculate real numbers, use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.

## Precautions for Correct Use

- Set the data type of Out to include the valid ranges of $\operatorname{In} 1$ and $\operatorname{In} 2$.
- If $\operatorname{In} 1, \operatorname{In} 2$, and Out are integers, make sure the division result will fit in the valid range of Out. Otherwise, the value of Out will be an illegal value. An error will not occur.
- The results for underflows in division are different for ladder diagrams and ST. In a ladder diagram, the calculation is performed within the range of the data type of the input variables. In ST, the precision of the numbers is increased to perform the calculation.
- Division results of positive infinity, negative infinity, or 0 are handled as follows for real number values.

|  |  | In1 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $+\infty$ | Positive number | 0 | Negative number | $-\infty$ |
| In2 | $+\infty$ | Nonnumeric data | 0 | 0 | 0 | Nonnumeric data |
|  | Positive number | $+\infty$ | Positive number | 0 | Negative number | $-\infty$ |
|  | 0 | $+\infty$ | $+\infty$ | Nonnumeric data | $-\infty$ | $-\infty$ |
|  | Negative number | $-\infty$ | Negative number | 0 | Positive number | $+\infty$ |
|  | $-\infty$ | Nonnumeric data | 0 | 0 | 0 | Nonnumeric data |

- If the value of either $\ln 1$ or $\operatorname{In} 2$ is nonnumeric data, the value of Out is nonnumeric data.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- In1, In2, and Out are integers and the value of $\ln 2$ is 0 .

## MOD

The MOD instruction finds the remainder for division of integers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MOD | Modulo－division | FUN |  | Out：＝ln1 MOD In2； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\ln 1$ | Dividend | Input | Dividend | Depends on data type． | -- |  |
| $\ln 2$ |  |  |  |  |  |  |
| Out | Remainder | Output | Remainder | Depends on data type． | --- |  |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { m } \\ & \text { o } \\ & \text { 일 } \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \hline \mathbf{\circ} \end{aligned}$ | $\underset{\text { m }}{\substack{\text { m }}}$ | $\begin{aligned} & \sum_{0}^{K} \\ & \text { 另 } \end{aligned}$ | 另 | $\begin{aligned} & \overline{\mathrm{N}} \\ & \text { O } \\ & \text { 品 } \end{aligned}$ | $\sum_{\underset{1}{\infty}}^{\substack{C}}$ | $\underset{\substack{-1}}{c}$ | ${\underset{z}{2}}_{\substack{C}}$ | $\sum_{\underset{1}{c}}^{c}$ | $\sum_{-1}^{\infty}$ | $\overline{\text { z }}$ | $\sum_{-1}^{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 奀 } \\ & \stackrel{N}{2} \end{aligned}$ | -1 <br> $\overline{3}$ <br> 而 | $\begin{aligned} & \text { 另 } \\ & \text { n } \end{aligned}$ | ö | 막 |  |
| In1 |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |
| In2 |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |

## Function

The MOD instruction divides dividend $\ln 1$ by divisor $\operatorname{In} 2$ to find the remainder．The data types of $\ln 1$ ， In2，and remainder Out can have different data types．
This instruction performs the calculation with the following formula．
Out $=\ln 1-(\ln 1 / \ln 2)^{*} \ln 2$（The decimal point is truncated in the division operation．）
Examples of the values of $\ln 1, \ln 2$ ，and Out are given in the following table．

| Value of $\boldsymbol{\operatorname { l n } 1}$ | Value of $\boldsymbol{\operatorname { I n } 2}$ | Value of Out |
| :--- | :--- | :--- |
| 5 | 3 | 2 |
| 5 | -3 | 2 |
| -5 | 3 | -2 |
| -5 | -3 | -2 |

The following example is for when $\operatorname{In} 1$ is INT\#18 and $\operatorname{In} 2$ is INT\#5. The value of variable abc will be INT\#3.

## Precautions for Correct Use

- Set the data type of Out to include the valid ranges of $\operatorname{In} 1$ and $\operatorname{In} 2$.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.

## ABS

The ABS instruction finds the absolute value of an integer or real number．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ABS | Absolute Value | FUN | $\begin{array}{ll}  & \begin{array}{ll} (@) \mathrm{ABS} \\ \\ -\mathrm{EN} & \mathrm{ENO} \end{array} \text { —Out } \end{array}$ | Out：＝ABS（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Number to <br> process | Input | Number to process | Depends on data type． | --- | ${ }^{* 1}$ |
| Out | Absolute <br> value | Output | Absolute value | Depends on data type． <br> ${ }^{*} 2$ | --- | --- |

＊1 If you omit an input parameter，the default value is not applied．A building error will occur．
＊2 Negative numbers are excluded．

|  | $\begin{aligned} & \text { © } \\ & \stackrel{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { ᄋ } \end{aligned}$ | $\begin{aligned} & \text { 䍐 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\Gamma$ $\sum_{0}$ D | $\underset{\underset{Z}{6}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ |  | $\frac{\underset{i}{c}}{\sum_{1}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\text { 윽 }}$ | $\sum_{-1}^{r}$ | $\begin{aligned} & \text { ग } \\ & \text { 苋 } \end{aligned}$ | $\begin{aligned} & \text { 另 } \\ & \text { 而 } \end{aligned}$ | $\begin{aligned} & \frac{-1}{3} \\ & \frac{1}{n} \end{aligned}$ | 号 | 금 | 머 | 号 |
| In |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The ABS instruction outputs the absolute value of the number to process $\operatorname{In}$ ．The data types of $\operatorname{In}$ and absolute value Out can have different data types．
The following example is for when $I n$ is REAL\＃－10．3．The value of variable $a b c$ will be REAL\＃10．3．

LD

ST
abc：＝ABS（REAL\＃－10．3）；

## Additional Information

When you calculate real numbers, use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.

## Precautions for Correct Use

- Set the data type of Out to include the absolute value of $I n$.
- If the value of In is positive infinity, negative infinity, or nonnumeric data, the value of Out is as shown below.

| Value of $\boldsymbol{I n}$ | Value of Out |
| :--- | :--- |
| $+\infty$ | $+\infty$ |
| $-\infty$ | $+\infty$ |
| Nonnumeric data | Nonnumeric data |

## RadToDeg and DegToRad

RadToDeg：Converts a real number from radians（rad）to degrees $\left(^{\circ}\right)$ ．
DegToRad：Converts a real number from degrees $\left({ }^{\circ}\right)$ to radians（rad）．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| RadToDeg | Radians to Degrees | FUN | $-{ }^{(@) \text { RadToDeg }}$ - EN - In | Out：＝RadToDeg（In）； |
| DegToRad | Degrees to Radians | FUN |  | Out：＝DegToRad（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | $\begin{array}{l}\text { Data to } \\ \text { convert }\end{array}$ | Input | Data to convert | Depends on data type． | $\begin{array}{l}\text { • RadToDeg：Radians } \\ \bullet\end{array}$ | ＊DegToRad：Degrees |$]$

|  | O <br> 0 <br> $\frac{0}{0}$ <br> 0 <br> 1 | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

－RadToDeg
The RadToDeg instruction converts the data to convert In from radians（rad）to degrees $\left(^{\circ}\right.$ ）．The fol－ lowing conversion is used．

$$
\text { Out=In*180/ } \pi
$$

## －DegToRad

The DegToRad instruction converts the data to convert In from degrees $\left({ }^{\circ}\right)$ to radians（rad）．The fol－ lowing conversion is used．

Out $=\operatorname{In}^{*} \pi / 180$

The following example for the DegToRad instruction is for when In is REAL\#45. The value of the REAL variable $a b c$ will be REAL\#0.785398.

LD

## Additional Information

Use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.

## Precautions for Correct Use

- If the absolute value of the conversion result exceeds the maximum value of the data type of Out, the value of Out will be positive or negative infinity.
- If the absolute value of the conversion result is lower than the minimum value of the data type of Out, the value of Out will be 0 .
- Make sure that the data type of Out is equal to or larger than the data type of In.
- If the value of $I n$ is positive infinity, negative infinity, or nonnumeric data, the value of Out is as shown below.

| Value of $\boldsymbol{I n}$ | Value of Out |
| :--- | :--- |
| $+\infty$ | $+\infty$ |
| $-\infty$ | $-\infty$ |
| Nonnumeric data | Nonnumeric data |

- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{\text { n }}$ | Data type of $\boldsymbol{\boldsymbol { n }}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## SIN，COS，and TAN

These instructions perform trigonometric calculations on real numbers．
SIN：Finds the sine of a number．
COS：Finds the cosine of a number．
TAN：Finds the tangent of a number．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SIN | Sine in Radians | FUN | $$ | Out：＝SIN（In）； |
| cos | Cosine in Radians | FUN | $\begin{aligned} & \begin{array}{ll} (@) \mathrm{COS} \\ - & \mathrm{EN} \\ - & \mathrm{ENO} \\ \hline \end{array} \\ & \hline \end{aligned}$ | Out：＝COS（In）； |
| TAN | Tangent in Radians | FUN | $\begin{array}{rl\|l}  & \begin{array}{ll} (@) T A N \\ & \text { EN } \\ - & \text { ENO } \\ \hline \end{array} \quad \text { Out } \end{array}$ | Out：＝TAN（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

These instructions perform trigonometric calculations on real numbers. Number to process in is an angle in radians (rad).

## - SIN

The SIN instruction finds the sine of $I n$.

## - TAN

The TAN instruction finds the tangent of In.

The following example for the COS instruction is for when In is REAL\#3.141592. The value of variable $a b c$ will be REAL\#-1.0.

## Additional Information

- Use the RadToDeg and DegToRad instructions (page 2-172) to convert between degrees and radians.
- If In for the TAN instruction is $n \pi / 2$, when $n$ is an integer, then the value of Out will be positive or negative infinity. Use the CheckReal instruction (page 2-209) to see if the value of Out is positive infinity or negative infinity.

## Precautions for Correct Use

- If the value of $I n$ is positive infinity, negative infinity, or nonnumeric data, the value of Out is nonnumeric data.
- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{I n}$ | Data type of $\boldsymbol{I n}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## ASIN，ACOS，and ATAN

These instructions perform inverse trigonometric calculations on real numbers．
ASIN：Finds the arc sine of a number．
ACOS：Finds the arc cosine of a number．
ATAN：Finds the arc tangent of a number．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ASIN | Principal Arc Sine | FUN |  | Out：＝ASIN（In）； |
| ACOS | Principal Arc Cosine | FUN | $\begin{aligned} \\ \hline \end{aligned}$ | Out：＝ACOS（In）； |
| ATAN | Principal Arc Tangent | FUN |  | Out：＝ATAN（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Number to process | Input | Number to process | Depends on data type． | －－－ | ＊ |
| Out | Calculation result | Output | Calculation result | －ASIN $-\pi / 2$ to $\pi / 2$ <br> －ACOS 0 to $\pi$ <br> －ATAN $-\pi / 2$ to $\pi / 2$ | rad | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 署 | $\begin{aligned} & \text { ロ } \\ & \underset{\sim}{n} \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O} \end{aligned}$ | $\frac{C}{\underset{Z}{C N}}$ | $\underset{\underset{J}{\mathrm{C}}}{\substack{C}}$ | $\frac{\text { 든 }}{\frac{0}{Z}}$ | $\frac{\mathrm{C}}{\underset{\lambda}{\mathrm{C}}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 윽 }}{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 䍗 } \\ & \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 号 } \\ & \text { 恧 } \end{aligned}$ | 긍 | 먹 | 号 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

These instructions perform inverse trigonometric calculations on real numbers．The calculation result Out is an angle in radians（rad）．

## －ASIN

The ASIN instruction finds the arc sine of $I n$ ．Out is between $-\pi / 2$ and $\pi / 2$ ．

## - ACOS

The ACOS instruction finds the arc cosine of $\operatorname{In}$. Out is between 0 and $\pi$.

## - ATAN

The ATAN instruction finds the arc tangent of $I n$. Out is between $-\pi / 2$ and $\pi / 2$.
If the value of $I n$ is positive infinity, the value of Out is $\pi / 2$. If the value of $I n$ is negative infinity, the value of Out is $-\pi / 2$.

The following example for the ACOS instruction is for when In is REAL\#-1.0. The value of variable $a b c$ will be REAL\#3.141592.

## Additional Information

Use the RadToDeg and DegToRad instructions (page 2-172) to convert between degrees and radians.

## Precautions for Correct Use

- If In is not between -1.0 and 1.0 for the ASIN or ACOS instruction, the value of Out is nonnumeric data. That also applies when the value of $I n$ is negative infinity, positive infinity, or nonnumeric data.
- If the value of $I n$ is nonnumeric data for the ATAN instruction, the value of Out is nonnumeric data.
- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{\text { n }}$ | Data type of $\boldsymbol{\boldsymbol { n }}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## SQRT

The SQRT instruction finds the square root of a number．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SQRT | Square Root | FUN |  | Out：＝SQRT（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Number to <br> process | Input | Number to process | Depends on data type． <br> ${ }^{*} 1$ | --- | ${ }^{* 2}$ |
| Out | Square root | Output | Square root | ${ }^{* 3}$ | --- | --- |

＊1 Negative numbers are excluded．
＊2 If you omit an input parameter，the default value is not applied．A building error will occur．
＊3 The valid range is $0.000000 \mathrm{e}+00$ to $1.844674 \mathrm{e}+19$ or positive infinity for REAL data．The valid range is $0.00000000000000 \mathrm{e}+000$ to $1.34078079299425 \mathrm{e}+154$ or positive infinity for LREAL data．

|  |  |  | s | ngs |  |  |  |  | Inte |  |  |  |  |  |  |  | imes a | du | io |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | （1） | $\begin{aligned} & \text { 罗 } \\ & \text { m } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { 另 } \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \sum_{0}^{0} \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O } \end{aligned}$ | $\underset{\underset{Z}{\mathbb{O}}}{\substack{C}}$ | $\underset{\substack{C}}{\substack{c}}$ | ${ }_{\underset{1}{0}}^{\underline{Z}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\sum_{-1}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\text { 민 }}{ }$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \underset{\sim}{\mathbf{m}} \\ & \stackrel{y}{2} \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 另 } \\ & \text { 翤 } \end{aligned}$ | 긍 | 먹 | 第 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

The SQRT instruction finds the square root of number to process $I n$ ．The data types of $I n$ and square root Out can have different data types．

The following example is for when In is REAL\#16.0. The value of variable abc will be REAL\#4.0.

LD

ST
abc:=SQRT(REAL\#16.0);

## Precautions for Correct Use

- If the value of $I n$ is not a positive number, the value of Out is as shown below.

| Value of $\boldsymbol{I n}$ | Value of Out |
| :--- | :--- |
| Negative number | Nonnumeric data |
| 0 | 0 |
| $+\infty$ | $+\infty$ |
| $-\infty$ | Nonnumeric data |
| Nonnumeric data | Nonnumeric data |

- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{\text { n }}$ | Data type of $\boldsymbol{I n}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## LN and LOG

These instructions find the logarithm of a real number.
LN : Finds the natural logarithm of a number.
LOG: Finds the base-10 logarithm of a number.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| LN | Natural Logarithm | FUN |  | Out:=LN(In); |
| LOG | Logarithm Base 10 | FUN |  | Out:=LOG(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Number to <br> process | Input | Number to process | Depends on data type. <br> ${ }^{*} 1$ | --- | ${ }^{* 2}$ |
| Out | Logarithm | Output | Logarithm | ${ }^{* 3}$ | --- | --- |

*1 Negative numbers are excluded.
*2 If you omit an input parameter, the default value is not applied. A building error will occur.
*3 LN:
If In and Out are REAL data: $-8.73365448 \mathrm{e}+1$ to $8.87228390 \mathrm{e}+1$, or $-\infty /+\infty$
If In is REAL and Out is LREAL data: $-8.7336544750000000 \mathrm{e}+1$ to $8.8722839050000000 \mathrm{e}+1$ or $-\infty /+\infty$
If $I n$ is LREAL and Out is REAL data: $-7.08384950 \mathrm{e}+2$ to $7.09782712 \mathrm{e}+2$ or $-\infty /+\infty$
If In and Out are LREAL data: $-7.0838495021978327 \mathrm{e}+1$ to $7.0978271289338399 \mathrm{e}+2$ or $-\infty /+\infty$
LOG:
If In and Out are REAL data: $-3.79297795 \mathrm{e}+1$ to $3.85318394 \mathrm{e}+1$ or $-\infty /+\infty$
If In is REAL and Out is LREAL data: $-3.7929779453965430 \mathrm{e}+1$ to $3.8531839419564961 \mathrm{e}+1$ or $-\infty /+\infty$
If $I n$ is LREAL and Out is REAL data: $-3.07652656 \mathrm{e}+2$ to $3.08254716 \mathrm{e}+2$ or $-\infty /+\infty$
If In and Out are LREAL data: $-3.0765265556858878 \mathrm{e}+2$ to $3.0825471555991674 \mathrm{e}+2$ or $-\infty /+\infty$

## Function

These instructions find the logarithm of a real number.

## - LN

The LN instruction finds the natural logarithm (logarithm to base e , where $\mathrm{e}=2.718282$ ).

## - LOG

The LOG instruction finds the base-10 logarithm.

The following example for the LOG instruction is for when In is REAL\#1000.0. The value of variable $a b c$ will be REAL\#3.0.

LD

## Additional Information

Use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.

## Precautions for Correct Use

- If the value of $I n$ is not a positive number, the value of Out is as shown below.

| Value of In | Value of Out |
| :--- | :--- |
| Negative number | Nonnumeric data |
| 0 | $-\infty$ |
| $+\infty$ | $+\infty$ |
| $-\infty$ | Nonnumeric data |
| Nonnumeric data | Nonnumeric data |

- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{\imath} \boldsymbol{n}$ | Data type of $\boldsymbol{\boldsymbol { n }}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## EXP

The EXP instruction performs calculations for the natural exponential function．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| EXP | Natural Exponen－ tial Operation | FUN |  | Out：＝EXP（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Exponent | Input | Exponent | Depends on data type． | --- | ${ }^{*} 1$ |
| Out | Calculation <br> result | Output | Calculation result | Depends on data type． <br> ${ }^{*} 2$ | --- |  |

＊1 If you omit an input parameter，the default value is not applied．A building error will occur．
＊2 Negative numbers are excluded．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 置 } \\ & \text { ? } \end{aligned}$ | $\begin{aligned} & \text { ロ } \\ & \text { 군 } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{\underset{1}{C}}{\substack{C}}$ | $\frac{\text { C }}{\frac{0}{Z}}$ | $\underset{\underset{1}{\mathrm{C}}}{\stackrel{C}{2}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{N}{2}}_{\square}^{0}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { D } \\ & \underset{\sim}{\boldsymbol{m}} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 置 } \end{aligned}$ | $\frac{-1}{\overline{1}}$ | $\begin{aligned} & \text { 另 } \\ & \text { 品 } \end{aligned}$ | 음 | 막 | 込 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

The EXP instruction returns the value of $e^{\ln }$ ，where $e$ is Euler＇s constant and $\ln$ is an input variable． The following example is for when In is REAL\＃1．0．The value of variable abc will be REAL\＃2．718282．
LD

ST
abc：＝EXP（REAL\＃1．0）；

## Additional Information

－Use the EXPT（＊＊）instruction（page 2－187）to find the powers of numbers with bases other than e．
－Use the CheckReal instruction（page 2－209）to see if Out is positive infinity，negative infinity，or non－ numeric data．

## Precautions for Correct Use

- If the value of In is 0.0 , positive infinity, negative infinity, or nonnumeric data, the value of Out is as shown below.

| Value of $\boldsymbol{\text { In }}$ | Value of Out |
| :--- | :--- |
| 0 | 1.0 |
| $+\infty$ | $+\infty$ |
| $-\infty$ | 0.0 |
| Nonnumeric data | Nonnumeric data |

- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{I n}$ | Data type of $\boldsymbol{\text { n }}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## EXPT (**)

The EXPT (**) instruction raises one real number to the power of another real number.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| EXPT (**) | Exponentiation | FUN |  | $\begin{aligned} & \text { Out:=EXPT(In, Pwr); } \\ & \text { Out:=In ** Pwr; } \end{aligned}$ |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Base number | Input | Base number (e.g., 5 for $5^{2}$ ) | Depends on data type. | --- | * |
| Pwr | Exponent |  | Exponent (e.g., 2 for $5^{2}$ ) |  |  |  |
| Out | Calculation result | Output | Calculation result | Depends on data type. | --- | --- |

* If you omit an input parameter, the default value is not applied. A building error will occur.

|  |  |  | Bit s | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \text { s, } \end{aligned}$ | $\begin{aligned} & \text { dur } \\ & \text { d te: } \end{aligned}$ | str |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O O O | $\begin{aligned} & \text { 四 } \\ & \text { n } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O } \end{aligned}$ | $\sum_{\underset{1}{6}}^{\substack{C}}$ | $\underset{\underset{i}{C}}{\substack{C}}$ | $\frac{\text { 들 }}{\frac{1}{2}}$ | $\frac{C}{\underset{1}{2}}$ | ${\underset{Z 1}{\infty}}_{\substack{\infty}}$ | $\bar{Z}_{1}$ | $\underset{\text { 인 }}{ }$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \text { r } \end{aligned}$ | $\stackrel{-1}{\overline{1}}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 응 | 막 |  |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Pwr |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

The EXPT (**) instruction raises base number $I n$ to exponent $P w r$ to find $I n P w r$.
The following example is for when In is REAL\#10.0 and Pwr is REAL\#3.0. The value of variable abc will be REAL\#1000.0.

LD

ST
abc:=EXPT(REAL\#10.0, REAL\#3.0);

The functions of the EXPT instruction and the ** instruction are exactly the same. Use the form that is easier to use.

## Additional Information

- Use the EXP instruction (page 2-185) to find powers of base e.
- Use the CheckReal instruction (page 2-209) to see if Out is positive infinity, negative infinity, or nonnumeric data.

## Precautions for Correct Use

- If the absolute value of the calculation result is lower than the minimum value for a real number, the value of Out will be 0 .

Example: $(1.175494 \mathrm{e}-38)^{2} \rightarrow 0$

- The following table shows the values of Out for different combinations of $I n$ and $P w r$ values.

|  |  | In |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $+\infty$ | $\begin{aligned} & 1 \text { to } \\ & +\infty \end{aligned}$ | 1 | 0 to 1 | 0 | -1 to 0 | -1 | $\begin{gathered} -1 \text { to } \\ -\infty \end{gathered}$ | $-\infty$ | Nonnumeric data |
| Pwr | $+\infty$ | $+\infty$ | $+\infty$ | 1 | 0 | 0 | 0 | 1 | $+\infty$ | $+\infty$ | Nonnumeric <br> data |
|  | Positive even number | $+\infty$ | Number *1, *2 |  |  | 0 | Number *1, *2 |  |  | $+\infty$ | Nonnumeric data |
|  | Positive odd number |  |  |  |  | Number *2, *3 | $-\infty$ |  |
|  | Positive decimal number |  |  |  |  | Nonnumeric data | $+\infty$ |  |
|  | 0 | 1 | 1 |  |  |  | 1 | 1 |  |  | 1 | 1 |
|  | Negative even number | 0 | Number *1, *2 |  |  |  | $+\infty$ | Number *1, *2 |  |  | 0 | Nonnumeric data |
|  | Negative odd number |  |  |  |  | Number *2, *3 |  |  |  |  |
|  | Negative decimal number |  |  |  |  | Nonnumeric data |  |  |  |  |
|  | $-\infty$ | 0 | 0 | 1 | $+\infty$ | $+\infty$ |  | $+\infty$ | 1 | 0 | 0 | Nonnumeric data |
|  | Nonnumeric data | Nonnumeric data | Nonnu | ric da |  | Nonnumeric data |  | Nonnum | ric data |  | Nonnumeric data | Nonnumeric data |

*1 If the calculation result exceeds the valid range of the data type of Out, the value of Out will be positive infinity.
*2 If the calculation result is too close to 0 to express with the data type of Out or if it is an unnormalized number, the value of Out will be 0 .
*3 If the calculation result exceeds the valid range of the data type of Out, the value of Out will be negative infinity.

- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{I n}$ | Data type of $\boldsymbol{\boldsymbol { n }}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## Inc and Dec

Inc: Increments an integer value.
Dec: Decrements an integer value.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Inc | Increment | FUN |  | Inc(InOut); |
| Dec | Decrement | FUN |  | Dec(InOut); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| InOut | Target data | In-out | Target data | Depends on data type. | --- | --- |
| Out | Return <br> value | Output | Always TRUE | TRUE only | --- | --- |

## Function

- Inc

The Inc instruction increments target data $\operatorname{InOut}$. If the result exceeds the maximum value of InOut , InOut returns to the minimum value.

## - Dec

The Dec instruction decrements target data InOut. If the result exceeds the minimum value of InOut , InOut returns to the maximum value.

The following example for the Inc instruction is for when variable $a b c$ is passed to InOut.
LD
 ST
Inc(abc);

## Precautions for Correct Use

Return value Out is not used when the instruction is used in ST.

## Rand

The Rand instruction generates pseudorandom numbers.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :---: | :---: |
| Rand | Random Number | FB | Rand_instance | Rand_instance(Execute, <br> Seed, Rnd); |
|  |  |  | Rand <br> Execute ENO |  |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Seed | Random num- <br> ber pattern | Input | Random number pattern | Depends on data type. | --- | ${ }^{*} 1$ |
| Rnd | Random num- <br> ber | Output | Random number | ${ }^{* 2}$ | --- | --- |

*1 If you omit the input parameter, the value will be 0 . It will not be the value that is specified for the Initial Value attribute.
*2 $0.00000000000000 \mathrm{e}+0$ to $1.00000000000000 \mathrm{e}+0$

## Function

The Rand instruction specifies random number Rnd. The value of Rnd is different each time the instruction is executed: Random number pattern Seed specifies the random number system. If the value of Seed is the same, the same random number series is generated each time the power supply is turned ON. This allows you to generate a repeatable series of random numbers.
If the value of Seed is 0 , random numbers that cannot be repeated are generated. If you do not want to generate the same series of random numbers each time the power supply is turned ON, set the value of Seed to 0 .
The following programming example is for when Seed is UINT\#1.

LD

ST
Rand_instance(A, UINT\#1, abc);

## Additional Information

The value of Rnd is a real number between 0 and 1 . Use the following processing to generate random numbers within a specific range.

Example: The following formula generates random numbers between 100 and 200. Rand_instance(A, UINT\#1, abc); Random number:=LREAL_TO_INT((200.0-100.0)*abc)+100;

## AryAdd

The AryAdd instruction adds corresponding elements of two arrays．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryAdd | Array Addition | FUN |  | AryAdd（In1，In2，Size，Ary－ Out）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1［］（array） and $\ln 2[]$ （array） | Array to process | Input | Array to process | Depends on data type． | －－－ | ＊ |
| Size | Number of elements to process |  | Number of elements to pro－ cess |  |  | 1 |
| AryOut［］ （array） | Calculation results array | In－out | Calculation results array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 䓢 } \\ & \stackrel{\circ}{\circ} \end{aligned}$ | $\underset{\text { m }}{\substack{\text { m }}}$ | $\begin{aligned} & \sum \\ & 0 \\ & 0 \end{aligned}$ | 0 0 0 0 |  | $\underset{\substack{\text { Con }}}{\substack{0 \\ \hline}}$ | ${\underset{i}{-1}}_{C}^{c}$ | $\underset{\underset{1}{0}}{\text { C }}$ | $\underset{\underset{\sim}{2}}{\substack{c}}$ | $\sum_{\boldsymbol{Z}}^{\infty}$ | $\overline{\text { z }}$ | ${\underset{Z}{2}}_{0}^{0}$ | $\sum_{\lambda}^{\Gamma}$ | $\stackrel{刃}{\text { m }}$ | $\stackrel{5}{\text { 「 }}$ | $\stackrel{-1}{2}$ | 号 | － | 닥 | 第 |
| In1［］（array） |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In2［］（array） | Must be an array with the same data type as In 1[]. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be an array with the same data type as $\ln 1[]$. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryAdd instruction adds Size elements of arrays to process $\operatorname{In} 1[]$ and $\operatorname{In} 2[]$ starting from $\operatorname{In} 1[0]$ and In2［0］．The results are assigned to corresponding elements of calculation results array AryOut [] ．

The following example is for when Size is UINT\#3.

## Precautions for Correct Use

- Use the same data type for In1[], In2[], and AryOut[].
- If the calculation results exceed the valid range of AryOut[], the results will be illegal values. An error will not occur. Corruption will not occur in the data in the memory area adjacent to those elements.
- The values in AryOut[] do not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- In1[], In2[], and AryOut[] have different data types.
- The value of Size exceeds the array range of In1[], In2p[], or AryOut[].

## AryAddV

The AryAddV instruction adds the same value to specified elements of an array．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryAddV | Array Value Addition | FUN |  | AryAddV（In1，In2，Size，Ary－ Out）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln 1[]$（array） | Addition array | Input | Addition array | Depends on data type． | －－－ | ＊ |
| In2 | Value to add |  | Value to add |  |  |  |
| Size | Number of elements |  | Number of elements of $\operatorname{In} 1[]$ for addition |  |  | 1 |
| AryOut［］ （array） | Addition results array | In－out | Addition results array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { © } \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ | Bit string |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 罟 |  | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{\underset{Z}{C}}{\substack{C}}$ |  | $\underset{\underset{1}{\prime}}{\stackrel{C}{2}}$ | $\sum_{-1}^{\infty}$ | $\sum_{-1}$ | ${\underset{Z}{2}}_{0}^{0}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { D } \\ & \text { N } \\ & \hline \end{aligned}$ |  | $\stackrel{-1}{\overline{3}}$ | 号 | －1 | 먹 | 足 |
| $\ln 1[]$（array） |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In2 | Must be same data type as In1［］． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be same data type as In1［］． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryAddV instruction adds value to add In2 to Size elements of addition array In1［］starting from In1［0］．It outputs the results to addition results array AryOut［］．

The following example is for when In2 is INT\#11 and Size is UINT\#3.

## Precautions for Correct Use

- Use the same data type for In1[], In2, and AryOut[].
- If the addition results exceed the valid range of AryOut[], the elements of AryOut[] will contain illegal values. An error will not occur. Corruption will not occur in the data in the memory area adjacent to those elements.
- The values in AryOut[] do not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- If In1[], In2, and AryOut[] have different data types.
- If the value of Size exceeds the array area of In1[] or AryOut[].

## ArySub

The ArySub instruction subtracts corresponding elements of two arrays．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ArySub | Array Subtraction | FUN |  | ArySub（In1，In2，Size，Ary－ Out）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln 1[]$（array） | Minuend array | Input | Minuend array | Depends on data type． | －－－ | ＊ |
| In2［］（array） | Subtra－ hend array |  | Subtrahend array |  |  |  |
| Size | Number of elements |  | Number of elements for sub－ traction |  |  | 1 |
| AryOut［］ （array） | Subtrac－ tion results array | In－out | Subtraction results array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { © } \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ | Bit string |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 罟 |  | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{\underset{Z}{C}}{\substack{C}}$ |  | $\underset{\underset{1}{\prime}}{\stackrel{C}{2}}$ | $\sum_{-1}^{\infty}$ | $\underset{1}{\underline{1}}$ | ${\underset{Z}{2}}_{0}^{0}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { D } \\ & \text { N } \\ & \hline \end{aligned}$ |  | $\stackrel{-1}{\overline{3}}$ | 号 | －1 | 먹 | 足 |
| $\ln 1[]$（array） |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In2［］（array） | Must be same data type as In1［］． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be same data type as In1［］． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The ArySub instruction subtracts Size elements of subtrahend array In2［］from corresponding ele－ ments of minuend array $\operatorname{In} 1[]$ starting with $\operatorname{In} 1[0]$ and $\operatorname{In} 2[0]$ ．It outputs the subtraction results to sub－ traction results array AryOut［］．

The following example is for when Size is UINT\#3.

## Precautions for Correct Use

- Use the same data type for In1[], In2[], and AryOut[].
- If the subtraction results exceed the valid range of AryOut[], the elements of AryOut[] will contain illegal values. An error will not occur. Corruption will not occur in the data in the memory area adjacent to those elements.
- The values in AryOut[] do not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- In1[], In2[], and AryOut[] have different data types.
- The value of Size exceeds the array range of In1[], In2[], or AryOut[].

## ArySubV

The ArySubV instruction subtracts the same value from specified elements of an array．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ArySubV | Array Value Subtraction | FUN |  | ArySubV（In1，In2，Size，Ary－ Out）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln 1[]$（array） | Minuend array | Input | Minuend array | Depends on data type． | －－－ | ＊ |
| In2 | Subtrahend |  | Subtrahend |  |  |  |
| Size | Number of elements |  | Number of elements of $\operatorname{In} 1[]$ for subtraction |  |  | 1 |
| AryOut［］ （array） | Subtrac－ tion results array | In－out | Subtraction results array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 罝 } \end{aligned}$ | $\underset{\text { m }}{\substack{\text { m }}}$ | $\begin{aligned} & \sum_{0}^{K} \\ & \text { D } \end{aligned}$ | 0 0 0 0 | $\begin{aligned} & \hline \sum_{0} \\ & \text { 召 } \end{aligned}$ | ${\underset{\sim}{1}}_{\substack{C}}$ | $\sum_{-1}^{C}$ | $\underset{\underset{Z}{0}}{\substack{C}}$ | $\sum_{\underset{1}{c}}^{\substack{c}}$ | $\sum_{-1}^{\infty}$ | $\overline{\text { E }}$ | $\underset{\substack{\mathrm{Z}}}{\mathrm{D}_{1}}$ | $\sum_{1}^{5}$ | $\stackrel{\text { 召 }}{\stackrel{1}{2}}$ | $\begin{aligned} & \text { n } \\ & \stackrel{\pi}{n} \\ & \stackrel{n}{2} \end{aligned}$ | $$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | －7 | 막 | － |
| In1［］（array） |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In2 | Must be same data type as the elements of $\ln 11[]$. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be same data type as $\ln 1[]$. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The ArySubV instruction subtracts subtrahend In2 from Size elements of minuend array In1［］start－ ing from $\operatorname{In} 1[0]$ ．It outputs the results to subtraction results array AryOut［］．

The following example is for when In2 is INT\#11 and Size is UINT\#3.

## Precautions for Correct Use

- Use the same data type for In1[], In2, and AryOut[].
- If the subtraction results exceed the valid range of AryOut[], the elements of AryOut[] will contain illegal values. An error will not occur. Corruption will not occur in the data in the memory area adjacent to those elements.
- The values in AryOut[] do not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- In1[], In2, and AryOut[] have different data types.
- The value of Size exceeds the array area of In1[] or AryOut[].

## AryMean

The AryMean instruction calculates the average of the elements of an array.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryMean | Array Mean | FUN |  | Out := AryMean(In, Size); |

## Variables

| Name | Meaning | 1/0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In[] (array) | Array to process | Input | Array to process | Depends on data type. | --- | * |
| Size | Number of elements to process |  | Number of $\ln []$ elements |  |  | 1 |
| Out | Calculation result | Output | Calculation result | Depends on data type. | --- | --- |

* If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

The AryMean instruction calculates the average of Size elements of array to process In[] starting from $\operatorname{In}[0]$.

The following example is for when Size is UINT\#5.

## Precautions for Correct Use

- Refer to the descriptions of the functions of the ADD (+) instruction (page 2-152), SUB (-) instruction (page 2-156), MUL (*) instruction (page 2-161), and DIV (/) instruction (page 2-166) for the calculation results when the value of $\ln []$ is positive infinity, negative infinity, or nonnumeric data.
- If $\operatorname{In}[]$ or Out is an integer, the decimal portion of the average is truncated.
- If you use a different data type for $\operatorname{In}[]$ and Out, make sure the valid range of Out includes the valid range of $\operatorname{In}[]$.
- If the calculation result exceeds the valid range of Out, Out will contain an illegal value. An error will not occur.
- If an intermediate value in the calculation process exceeds the valid range of $I N[]$, Out will contain an illegal value. An error will not occur.
- If the value of Size is 0 , the value of Out is 0 .
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The value of Size exceeds the array area of $\operatorname{In}[]$.

## ArySD

The ArySD instruction calculates standard deviation of the elements of an array.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ArySD | Array Element Standard Deviation | FUN |  | Out:=ArySD(In, Size); |

## Variables

| Name | Meaning | 1/0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In[] (array) | Array to process | Input | Array to process | Depends on data type. | --- | * |
| Size | Number of elements |  | Number of elements of $\operatorname{In}[]$ for conversion |  |  | 2 |
| Out | Standard deviation | Output | Standard deviation | Depends on data type. | --- | --- |

* If you omit an input parameter, the default value is not applied. A building error will occur.

|  | $\begin{aligned} & \text { © } \\ & \stackrel{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ |  | Bit | ings |  |  |  |  | Int |  |  |  |  |  |  |  | mes | $\begin{aligned} & \text { dur } \\ & \text { d te } \end{aligned}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \text { m } \\ & \text { 구N } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{\sim}{1}}_{\substack{C}}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\substack{\text { 들 }}}{ }$ | $\underset{\underset{1}{C}}{\stackrel{C}{5}}$ | ${\underset{Z}{2}}_{\substack{0}}$ | $\bar{Z}$ | $\frac{0}{Z}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { D } \\ & \text { m } \\ & \hline \end{aligned}$ |  | $\frac{-1}{\overline{1}}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 긍 | 막 | O |
| In[] (array) |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

The ArySD instruction calculates the standard deviation of Size elements of array to process In[] starting from In[0].
Standard deviation $=\sqrt{\frac{\sum_{i}(\ln [i]-\ln M)^{2}}{\text { Size-1 }}}$
$i$ : Subscript of $\operatorname{In}[], 0$ to Size - 1 $\operatorname{InM}$ : Average value of $\operatorname{In}[0]$ to $\operatorname{In}[$ Size - 1]

The following example is for when Size is UINT\#5.

## Precautions for Correct Use

- If the value of Size is 0 or 1 , the value of Out is 0 .
- If an intermediate value in the calculation process exceeds the valid range of $I N[]$, Out will contain an illegal value. An error will not occur.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The value of Size exceeds the array area of $\operatorname{In}[]$.

## ModReal

The ModReal instruction calculates the remainder of real number division.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ModReal | Real Number Modulo-division | FUN |  | Out:=ModReal(In1, In2); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Dividend | Input | Dividend | Depends on data type. | --- | * |
| In2 | Divisor |  | Divisor |  |  |  |
| Out | Remainder | Output | Remainder | Depends on data type. | --- | --- |

* If you omit an input parameter, the default value is not applied. A building error will occur.

## Function

The ModReal instruction divides dividend $\ln 1$ by divisor $\ln 2$ to find the remainder.
The following example is for when $\operatorname{In} 1$ is REAL\#-9.9 and In2 is REAL\#-3.14. The value of variable $a b c$ will be REAL\#-0.48.

LD

ST
abc:=ModReal(REAL\#-9.9, REAL\#-3.14);

## Additional Information

Use the CheckReal instruction (page 2-209) to see if the value of Out is positive infinity, negative infinity, or nonnumeric data.

## Precautions for Correct Use

- The following table shows the values of Out for different combinations of $\operatorname{In} 1$ and $\operatorname{In} 2$ values.

|  |  | In1 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 0 | Number | $+\infty$ | $-\infty$ | Nonnumeric data |
| In2 | 0 | Nonnumeric data | Nonnumeric data | Nonnumeric data | Nonnumeric data | Nonnumeric data |
|  | Number | 0 | Remainder of In1/In2 | Nonnumeric data | Nonnumeric data | Nonnumeric data |
|  | $+\infty$ | 0 | Value of In1 | Nonnumeric data | Nonnumeric data | Nonnumeric data |
|  | $-\infty$ | 0 | Value of In1 | Nonnumeric data | Nonnumeric data | Nonnumeric data |
|  | Nonnumeric data | Nonnumeric data | Nonnumeric data | Nonnumeric data | Nonnumeric data | Nonnumeric data |

- If you pass an integer parameter to $\ln 1$ or $\operatorname{In} 2$, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{\operatorname { l n } 1}$ or $\boldsymbol{I n} \mathbf{2}$ | Data type of $\boldsymbol{\operatorname { n } 1}$ or $\boldsymbol{\operatorname { n } 2}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## Fraction

The Fraction instruction finds the fractional part of a real number.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :---: | :---: |
| Fraction | Real Number <br> Fraction | FUN | Out:=Fraction(In); <br>  |  |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Real num- <br> ber | Input | Real number | Depends on data type. | --- | $*$ |
| Out | Fractional <br> part | Output | Fractional part | Depends on data type. | --- | --- |

* If you omit an input parameter, the default value is not applied. A building error will occur.

## Function

The Fraction instruction finds the fractional part of real number In.
The following example is for when In is REAL\#-123.456. The value of variable $a b c$ will be REAL\#-0.456.

## Additional Information

- Use the CheckReal instruction (page 2-209) to see if the value of Out is positive infinity, negative infinity, or nonnumeric data.
- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{\imath} \boldsymbol{n}$ | Data type of $\boldsymbol{\boldsymbol { n }}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## CheckReal

The CheckReal instruction checks a real number to see if it is infinity or nonnumeric data.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CheckReal | Real Number Check | FUN |  | CheckReal(In, Nan, PosInfinite, NegInfinite); |

## Variables

| Name | Meaning | 1/0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Real number | Input | Real number | Depends on data type. | --- | * |
| Out | Return value | Output | Always TRUE | TRUE only | --- | --- |
| Nan | Nonnumeric data check result |  | TRUE: Nonnumeric data FALSE: Not nonnumeric data | Depends on data type. |  |  |
| PosInfinite | Positive infinity check result |  | TRUE: Positive infinity FALSE: Not positive infinity |  |  |  |
| Neglnfinite | Negative infinity check result |  | TRUE: Negative infinity FALSE: Not negative infinity |  |  |  |

* If you omit an input parameter, the default value is not applied. A building error will occur.

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times, durations, dates, and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \text { ロ } \\ & \text { In } \end{aligned}$ | $\begin{aligned} & \sum \\ & \sum_{0}^{D} \\ & \end{aligned}$ | 0 0 0 0 0 | $\sum_{0}$ 0 0 | $\frac{C}{\mathbb{N}}$ | $\sum_{-1}^{C}$ | $\frac{0_{i}^{\prime}}{\underset{1}{2}}$ | $\frac{\underset{Z}{C}}{\underset{1}{c}}$ | $\sum_{\underset{1}{\prime}}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{N}{2}}_{0}$ | $\bar{z}_{\underset{1}{2}}$ | $\begin{aligned} & \text { D } \\ & \text { N } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \underset{\sim}{\mathbb{T}} \\ & \stackrel{y}{2} \end{aligned}$ | $\frac{-1}{\overline{3}}$ | $\begin{aligned} & \text { 밈 } \\ & \hline 1 \end{aligned}$ | -1 | 먹 | O |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Nan | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| PosInfinite | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Neglnfinite | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The CheckReal instruction checks a real number In to see if it is nonnumeric data, positive infinity, or negative infinity. It outputs the results to Nan, PosInfinite, and NegInfinite.
The following figure shows a programming example. The values of REAL variables $a$ and $b$ are multiplied and the result is tested to see if it is a real number. If the multiplication result is a real number, it is assigned to variable $d$.

LD

ST
$\mathrm{c}:=\mathrm{a}$ *;
CheckReal(c, abc, def, ghi);
IF ( (abc=FALSE) AND (def=FALSE) AND (ghi=FALSE) ) THEN d:=c;
END_IF;

## Additional Information

Use this instruction on the result of a math instruction that handles real numbers to see if the result is nonnumeric data, positive infinity, or negative infinity.

## Precautions for Correct Use

- Return value Out is not used when the instruction is used in ST.
- If you pass an integer parameter to In, the data type is converted as follows:

| Data type of parameter that is <br> passed to $\boldsymbol{I n}$ | Data type of $\boldsymbol{I n}$ |
| :--- | :--- |
| USINT, UINT, SINT, or INT | REAL |
| UDINT or DINT | LREAL |
| ULINT or LINT | A building error will occur. |

## BCD Conversion Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| ${ }^{* *}$ BCD_TO_*** | BCD-to-Unsigned Integer Conver- <br> sion Group | $2-212$ |
| ${ }^{* *}$ TO_BCD_*** $^{*}$ | Unsigned Integer-to-BCD Conver- <br> sion Group | $2-215$ |
| BCD_TO_** | BCD Data Type-to-Unsigned Inte- <br> ger Conversion Group | $2-218$ |
| BCDsToBin | Signed BCD-to-Signed Integer <br> Conversion | $2-221$ |
| BinToBCDs_** | Signed Integer-to-BCD Conver- <br> sion Group | $2-224$ |
| AryToBCD | Array BCD Conversion | $2-227$ |
| AryToBin | Array Unsigned Integer Conver- <br> sion | $2-229$ |

## **_BCD_TO_***

These instructions convert BCD bit strings into unsigned integers.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| **_BCD_TO_** | BCD-to-Unsigned Integer Conversion Group | FUN |  | Out:=**_BCD_TO_*** (In); <br> must be a bit string data type. <br> "***" must be an integer data type. |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver- <br> sion result | Output | Conversion result | $*$ | --- | --- |

* The valid ranges depend on the data types of In and Out. Refer to Function, below, for details.

|  |  |  | Bit | ings |  |  |  |  | Inte | gers |  |  |  |  |  |  | $\begin{aligned} & \mathrm{mes} \\ & \mathrm{~s}, \mathrm{a} \end{aligned}$ | $\begin{aligned} & \text { dur: } \\ & \text { d te) } \end{aligned}$ | $\begin{aligned} & \text { tion } \\ & \text { str } \end{aligned}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O <br> O |  | $\sum_{0}^{0}$ 0 | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O } \end{aligned}$ | $\sum_{\underset{1}{6}}^{\substack{C}}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\substack{\mathrm{Z}}}{\text { 든 }}$ | $\underset{\underset{1}{C}}{\bar{C}}$ | ${\underset{-1}{\infty}}_{\infty}^{\infty}$ | $\sum_{1}$ | $\underset{\sim}{2}$ | $\bar{K}_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{m}{2} \end{aligned}$ | $\begin{aligned} & \text { 글 } \\ & \frac{1}{n} \end{aligned}$ | 号 | 금 | 막 |  |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |

## Function

These instructions convert data to convert In (which must be a BCD bit string) into an unsigned integer. The name of the instruction is determined by the data types of In and conversion result Out. For example, if $I n$ is WORD data and Out is UINT data, the name of the instruction is WORD_BCD_TO_UINT. The following example for the WORD_BCD_TO_UINT instruction is for when In is WORD16\#3452.

## LD

ST
abc:=WORD_BCD_TO_UINT(WORD\#16\#3452);

The following table shows the valid ranges for In and Out according to their data types.

| Datatype of $\boldsymbol{I n}$ | Data type of Out | Valid range for In | Valid range for Out |
| :---: | :---: | :---: | :---: |

## Additional Information

- To convert a BCD bit string to an integer, use a BCD_TO_** instruction (page 2-218).
- To convert an integer to a BCD bit string, use a **_TO_BCD_*** instruction (page 2-215).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If the data size of Out is larger than the data size of $I n$, the upper digits of Out will contain 0 .
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of $I n$ is outside of the valid range.
- The value in In is not BCD bit string data (i.e., contains A, B, C, D, E, or F hexadecimal).

## **_TO_BCD_***

These instructions convert unsigned integers to BCD bit strings.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| **_TO_BCD_** | Unsigned Integer-to-BCD Conversion Group | FUN | "**" must be an integer data type. "****" must be a bit string data type. | Out:=**_TO_BCD_*** (In); <br> "**" must be an integer data type. <br> "***" must be a bit string data type. |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver- <br> sion result | Output | Conversion result | $*$ | --- | --- |

* The valid ranges depend on the data types of In and Out. Refer to Function, below, for details.

## Function

These instructions convert data to convert In (which must be an unsigned integer) to a BCD bit string.
The name of the instruction is determined by the data types of In and conversion result Out. For example, if In is UINT data and Out is WORD data, the name of the instruction is UINT_TO_BCD_WORD.
The following example for the UINT_TO_BCD_WORD instruction is for when In is UNIT\#3452.

LD

abc:=UINT_TO_BCD_WORD(UINT\#3452);

The following table shows the valid ranges for In and Out according to their data types.

| Datatype of $\boldsymbol{I n}$ | $\begin{gathered} \text { Data type } \\ \text { of Out } \end{gathered}$ | Valid range for In | Valid range for Out |
| :---: | :---: | :---: | :---: |
| USINT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
|  | WORD | 0 to 255 | 16\#0000 to 16\#0255 (BCD) |
|  | DWORD |  | 16\#0000_0000 to 16\#000_0255 (BCD) |
|  | LWORD |  | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0000_0000_0255 (BCD) } \end{aligned}$ |
| UINT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
|  | WORD | 0 to 9999 | 16\#0000 to 16\#9999 (BCD) |
|  | DWORD | 0 to 65535 | 16\#0000_0000 to 16\#0006_5535 (BCD) |
|  | LWORD |  | 16\#0000_0000_0000_0000 to 16\#0000_0000_0006_5535 (BCD) |
| UDINT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
|  | WORD | 0 to 9999 | 16\#0000 to 16\#9999 (BCD) |
|  | DWORD | 0 to 99999999 | 16\#0000_0000 to 16\#9999_9999 (BCD) |
|  | LWORD | 0 to 4294967295 | $\begin{aligned} & \hline \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0042_9496_7295 (BCD) } \end{aligned}$ |
| ULINT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
|  | WORD | 0 to 9999 | 16\#0000 to 16\#9999 (BCD) |

|  | LWORD | 0 to 9999999999999999 | $\begin{aligned} & \hline \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#9999_9999_9999_9999 (BCD) } \end{aligned}$ |
| SINT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
|  | WORD | 0 to 127 | 16\#0000 to 16\#0127 (BCD) |
|  | DWORD |  | 16\#0000_0000 to 16\#0000_0127 (BCD) |
|  | LWORD |  | $\begin{aligned} & \hline \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0000_0000_0127 (BCD) } \end{aligned}$ |
| INT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
|  | WORD | 0 to 9999 | 16\#0000 to 16\#9999 (BCD) |
|  | DWORD | 0 to 32767 | 16\#0000_0000 to 16\#0003_2767 (BCD) |
|  | LWORD |  | $\begin{aligned} & \hline \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0000_0003_2767 (BCD) } \end{aligned}$ |
| DINT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
|  | WORD | 0 to 9999 | 16\#0000 to 16\#9999 (BCD) |
|  | DWORD | 0 to 99999999 | 16\#0000_0000 to 16\#9999_9999 (BCD) |
|  | LWORD | 0 to 2147483647 | $\begin{aligned} & \hline \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0021_4748_3647 (BCD) } \end{aligned}$ |
| LINT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
|  | WORD | 0 to 9999 | 16\#0000 to 16\#9999 (BCD) |
|  | DWORD | 0 to 99999999 | 16\#0000_0000 to 16\#9999_9999 (BCD) |
|  | LWORD | 0 to 9999999999999999 | 16\#0000_0000_0000_0000 to 16\#9999_9999_9999_9999 (BCD) |

## Additional Information

- To convert a specific BCD bit string to an integer, use a **_BCD_TO_*** instruction (page 2-212).
- To convert a BCD bit string to an integer, use a BCD_TO_** instruction (page 2-218).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If the data size of Out is larger than the data size of $I n$, the upper digits of Out will contain 0.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The value of $I n$ is outside of the valid range.

## BCD_TO

The $\mathrm{BCD}_{-} \mathrm{TO}_{-}^{* *}$ instruction converts BCD bit strings into unsigned integers.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| BCD_TO_** | BCD Data Type-toUnsigned Integer Conversion Group | FUN | "**" must be an integer data type. | Out:=BCD_TO_** (In); <br> "**" must be an integer data type. |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | ${ }^{* 1}$ | --- | ${ }^{* 2}$ |
| Out | Conver- <br> sion result | Output | Conversion result | ${ }^{* 1}$ | --- | --- |

*1 The valid ranges depend on the data types of In and Out. Refer to Function, below, for details.
*2 If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

These instructions convert data to convert In (which must be a BCD bit string) into an unsigned integer. The name of the instruction is determined by the data type of conversion result Out. For example, if Out is the UINT data type, the instruction is BCD_TO_UINT.
The following example for the BCD_TO_UINT instruction is for when In is WORD\#16\#3452.

LD

ST
abc:=BCD_TO_UINT(WORD\#16\#3452);

The following table shows the valid ranges for In and Out according to their data types.

| Data type of $\boldsymbol{I n}$ | Data type of Out | Valid range for In | Valid range for Out |
| :---: | :---: | :---: | :---: |
| BYTE | USINT | 16\#00 to 16\#99 (BCD) | 0 to 99 |
|  | UINT |  |  |
|  | UDINT |  |  |

|  | SINT |  |  |
|  | INT |  |  |
|  | DINT |  |  |
|  | LINT |  |  |
| WORD | USINT | 16\#0000 to 16\#0255 (BCD) | 0 to 255 |
|  | UINT | 16\#0000 to 16\#9999 (BCD) | 0 to 9999 |
|  | UDINT |  |  |
|  | ULINT |  |  |
|  | SINT | 16\#0000 to 16\#0127 (BCD) | 0 to 127 |
|  | INT | 16\#0000 to 16\#9999 (BCD) | 0 to 9999 |
|  | DINT |  |  |
|  | LINT |  |  |
| DWORD | USINT | 16\#0000_0000 to 16\#0000_0255 (BCD) | 0 to 255 |
|  | UINT | 16\#0000_0000 to 16\#0006_5535 (BCD) | 0 to 65535 |
|  | UDINT | 16\#0000_0000 to 16\#9999_9999 (BCD) | 0 to 99999999 |
|  | ULINT |  |  |
|  | SINT | 16\#0000_0000 to 16\#0000_0127 (BCD) | 0 to 127 |
|  | INT | 16\#0000_0000 to 16\#0003_2767 (BCD) | 0 to 32767 |
|  | DINT | 16\#0000_0000 to 16\#9999_9999 (BCD) | 0 to 99999999 |
|  | LINT |  |  |
| LWORD | USINT | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0000_0000_0255 (BCD) } \end{aligned}$ | 0 to 255 |
|  | UINT | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0000_0006_5535 (BCD) } \end{aligned}$ | 0 to 65535 |
|  | UDINT | $\begin{aligned} & \hline \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0042_9496_7295 (BCD) } \end{aligned}$ | 0 to 4294967295 |
|  | ULINT | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#9999_9999_9999_9999 (BCD) } \end{aligned}$ | 0 to 9999999999999999 |
|  | SINT | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0000_0000_0127 (BCD) } \end{aligned}$ | 0 to 127 |
|  | INT | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & 16 \# 0000 \_0000 \_0003 \_2767 \text { (BCD) } \end{aligned}$ | 0 to 32767 |
|  | DINT | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#0000_0021_4748_3647 (BCD) } \end{aligned}$ | 0 to 2147483647 |
|  | LINT | $\begin{aligned} & \hline \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#9999_9999_9999_9999 (BCD) } \end{aligned}$ | 0 to 9999999999999999 |

## Additional Information

- To convert a specific BCD bit string to an integer, use a **_BCD_TO_*** instruction (page 2-212).
- To convert an integer to a BCD bit string, use a **_TO_BCD_*** instruction (page 2-215).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of Out.
- If the data size of Out is larger than the data size of $I n$, the upper digits of Out will contain 0.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of $I n$ is outside of the valid range.
- The value in $I n$ is not BCD bit string data (i.e., contains A, B, C, D, E, or F hexadecimal).

## BCDsToBin

The BCDsToBin instruction converts signed BCD bit strings to signed integers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| BCDsToBin | Signed BCD－to－ Signed Integer Conversion | FUN |  | Out：＝BCDsToBin（In，Format）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Data to convert | Input | Data to convert | ＊1 | －－－ | ＊2 |
| Format | Data format number |  | Format of BCD bit string | ＿BCD0 to＿BCD3 |  | BCD0 |
| Out | Conver－ sion result | Output | Conversion result | ＊1 | －－－ | －－－ |

＊1 The valid range depends on the value of Format．Refer to Function，below，for details．
＊2 If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { O } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 圌 } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\sum_{-1}^{C}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{\text { 득 }}{\underset{1}{2}}$ | $\frac{\mathrm{C}}{\underset{i}{\mathrm{C}}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\substack{\mathrm{D}}}{\text { on }}$ | $\sum_{-1}$ | $\begin{aligned} & \text { ग } \\ & \text { 亚 } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{m}{2} \end{aligned}$ | $\begin{aligned} & \frac{-1}{1} \\ & \frac{1}{n} \end{aligned}$ | 号 | －1 | 믹 |  |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Format | Refer to Function for the enumerators of the enumerated type＿eBCD＿FORMAT． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | Must be a signed integer data type that is the same size as In． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The BCDsToBin instruction converts signed BCD bit string In to a signed integer．

The data type of data format number Format is enumerated type _eBCD_FORMAT. Select one of the following: _BCD0, _BCD1, _BCD2, or _BCD3. The sign specification in the upper four bits of In depends on the BCD format number. The data format examples shown below use WORD data for In.

The same sizes of data types are used for In and Out. The valid ranges depend on the value of Format, as shown below.

|  |  | Value of Format |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | BCDO | BCD1 | BCD2 | BCD3 |
| Data type of In <br> Data type of Out | $\begin{gathered} \hline \text { BYTE } \\ \downarrow \\ \text { SINT } \end{gathered}$ | -9 to 9 | -79 to 79 | -9 to 99 | -19 to 99 |
|  |  | -999 to 999 | -7999 to 7999 | -999 to 9999 | -1999 to 9999 |
|  | DWORD DINT | -9999999 to 9999999 | $\begin{aligned} & \hline-79999999 \text { to } \\ & 79999999 \end{aligned}$ | -9999999 to 99999999 | $\begin{aligned} & \hline-19999999 \text { to } \\ & 99999999 \end{aligned}$ |
|  | LWORD LINT | $-999999999999999 \text { to }$ 999999999999999 | $\begin{array}{\|l\|} \hline-7999999999999999 \text { to } \\ 7999999999999999 \end{array}$ | $\begin{array}{\|l} \hline-999999999999999 \text { to } \\ 9999999999999999 \end{array}$ | $\begin{aligned} & -19999999999999999 \text { to } \\ & 9999999999999999 \end{aligned}$ |

The following example is for when In is WORD\#2\#1011_0100_0101_0010 and Format is _BCD1.

## Precautions for Correct Use

- Use the same sizes of data types for In and Out.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Format is _BCD0 and the upper digit of $I n$ is 2 to F .
- The value of Format is _BCD2 and the upper digit of In is A to E .
- The value of Format is _BCD3 and the upper digit of $I n$ is $B$ to $E$.
- Except for the above conditions, any digit in In is A to F.
- The value of Format is outside of the valid range.

## BinToBCDs

These instructions convert signed integers to signed BCD bit strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| BinToBCDs＿＊＊ | Signed Integer－to－ BCD Conversion Group | FUN |  | Out：＝BinToBCDs（In，For－ mat）； <br> must be a bit string data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Data to convert | Input | Data to convert | ＊ | －－－ | 0 |
| Format | Data format number |  | Format of BCD bit string | ＿BCD0 to＿BCD3 |  | ＿BCD0 |
| Out | Conver－ sion result | Output | Conversion result | ＊ | －－－ | －－－ |

＊The valid range depends on the value of Format．Refer to Function，below，for details．

| In |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK |  |  |  |  |  |  |  |
| Format | Refer to Function for the enumerators of the enumerated type＿eBCD＿FORMAT． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | Must be same size of data type as In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions convert signed integer In to a signed BCD bit string．
The name of the instruction is determined by the data type of Out．For example，if Out is the WORD data type，the instruction is BinToBCDs＿WORD．

The data type of data format number Format is enumerated type _eBCD_FORMAT. Select one of the following: _BCD0, _BCD1, _BCD2, or _BCD3. The sign specification in the upper four bits of Out depends on the BCD format number. The data format examples shown below use WORD data for Out.

Sign bit
0: Positive
1: Negative

Format =_BCD3
Valid range of Out. -1999 to 9999 (BCD)

\#0 to \#9: BCD digit 4 (positive) \#A: Negative, BCD digit 4 is 1 \#F: Negative, BCD digit 4 is 0 (\#B to \#E: error)

The same sizes of data types are used for In and Out. The valid ranges depend on the value of Format, as shown below.

|  |  | Value of Format |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | BCDO | BCD1 | BCD2 | BCD3 |
| Data type of <br> In <br> Data type of Out | $\begin{gathered} \text { SINT } \\ \downarrow \\ \text { BYTE } \end{gathered}$ | -9 to 9 | -79 to 79 | -9 to 99 | -19 to 99 |
|  | $\begin{gathered} \text { INT } \\ \downarrow \\ \text { WORD } \end{gathered}$ | -999 to 999 | -7999 to 7999 | -999 to 9999 | -1999 to 9999 |
|  | DINT $\downarrow$ DWORD | -9999999 to 9999999 | $\begin{aligned} & -79999999 \text { to } \\ & 79999999 \end{aligned}$ | -9999999 to 99999999 | $\begin{aligned} & -19999999 \text { to } \\ & 99999999 \end{aligned}$ |
|  | LINT $\downarrow$ LWORD | $\begin{aligned} & -999999999999999 \text { to } \\ & 999999999999999 \end{aligned}$ | $\begin{aligned} & -7999999999999999 \text { to } \\ & 7999999999999999 \end{aligned}$ | -9999999999999999 to 9999999999999999 | -1999999999999999 to 9999999999999999 |

The following example shows the BinToBCDs_WORD instruction when In is INT\#-3452 and Format is _BCD1.

## Precautions for Correct Use

- Always use the correct instruction name for the data type of Out.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of $I n$ is outside of the valid range.
- The value of Format is outside of the valid range.

## AryToBCD

The AryToBCD instruction converts the elements of an unsigned integer array to BCD bit strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryToBCD | Array BCD Conversion | FUN |  | AryToBCD（In，Size，Ary－ Out）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln []$（array） | Unsigned integer array | Input | Unsigned integer array | ＊1 | －－－ | ＊2 |
| Size | Number of elements |  | Number of elements of $\operatorname{In}[]$ for conversion | Depends on data type． |  | 1 |
| AryOut［］ （array） | BCD array | In－out | BCD array | ＊1 | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊1 The valid ranges depend on the data types of the elements of In［］and AryOut［］．Refer to Function for details．
＊2 If you omit an input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { o } \\ & \text { o } \\ & \text { 응 } \end{aligned}$ |  | S | ngs |  |  |  |  | Inte | ers |  |  |  |  |  |  | $\begin{aligned} & \text { imes } \\ & \text { s, } \end{aligned}$ | dur | ion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 罥 | $\begin{aligned} & \text { 䍐 } \\ & \text { n } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{-1}{C}$ | $\underset{\substack{\text { 을 }}}{ }$ | $\underset{\underset{1}{\overline{1}}}{\stackrel{C}{1}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{Z}{2}}_{0}^{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ |  | －긏 | 号 | 금 | 먹 | 翟 |
| In［］（array） |  |  |  |  |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be a bit string array．The data type must be the same size as the elements of $\operatorname{In}[]$. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryToBCD instruction converts Size elements of unsigned integer array $\operatorname{In}[]$ starting from $\operatorname{In}[0]$ to a $B C D$ bit string. It outputs the BCD bit string to BCD array AryOut[].
The following example is for when Size is UINT\#3.

The following table shows the valid ranges for $\operatorname{In}[]$ and AryOut [] according to the data types of their elements.

| Data type of the elements of $\ln []$ | Data type of the elements of AryOut[] | Valid range of $\operatorname{In}[]$ | Valid range of AryOut[] |
| :---: | :---: | :---: | :---: |
| USINT | BYTE | 0 to 99 | 16\#00 to 16\#99 (BCD) |
| UINT | WORD | 0 to 9999 | 16\#0000 to 16\#9999 (BCD) |
| UDINT | DWORD | 0 to 99999999 | $\begin{aligned} & \hline \text { 16\#0000_0000 to } \\ & \text { 16\#9999_9999 (BCD) } \end{aligned}$ |
| ULINT | LWORD | 0 to 9999999999999999 | 16\#0000_0000_0000_0000 to 16\#9999_9999_9999_9999 (BCD) |

## Precautions for Correct Use

- Use the same data type and size for $\operatorname{In}[]$ and AryOut[]. For example, if the elements of $\operatorname{In}[]$ are UINT data, use WORD as the data type of the elements of AryOut[].
- This instruction does not convert signed binary to signed BCD. Use an unsigned integer (USINT, UINT, UDINT, or ULINT) as the data type of $\ln []$.
- The values in AryOut[] do not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- The value of $\ln []$ is outside of the valid range.
- The data type sizes of $\operatorname{In}[]$ and AryOut[] are different.
- The value of Size exceeds the array area of In[] or AryOut[].

## AryToBin

The AryToBin instruction converts the elements of an array of BCD bit strings into unsigned integers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryToBin | Array Unsigned Integer Conversion | FUN |  | AryToBin（In，Size，Ary－ Out）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln []$（array） | Array of BCD bit strings | Input | Array of BCD bit strings | ＊1 | －－－ | ＊2 |
| Size | Number of elements |  | Number of elements of $\operatorname{In}[]$ for conversion | Depends on data type． |  | 1 |
| AryOut［］ （array） | Unsigned integer array | In－out | Unsigned integer array | ＊1 | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊1 The valid ranges depend on the data types of the elements of $\operatorname{In}[]$ and AryOut［］．Refer to Function for details．
＊2 If you omit an input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { O} \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ |  | Bit | ring |  |  |  |  | Inte |  |  |  |  |  |  |  | mes | $\begin{aligned} & \text { dur } \\ & \text { d te } \end{aligned}$ | ion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \\ & \text { ㅇ } \end{aligned}$ | $\underset{\sim}{\text { ロ⿴囗 }}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 0 $\sum_{0}$ 召 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{\mathrm{O}}{\underset{Z}{\mathrm{Z}}}$ | $\frac{\mathrm{C}}{\underset{\lambda}{\mathrm{C}}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{Z}{2}}_{\text {민 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { 范 } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 罠 } \\ & \hline \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 금 | 머 | n 式 n |
| In［］（array） |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be an unsigned integer array．The data type must be the same size as the elements of $\operatorname{In}[]$ ． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryToBin instruction converts Size elements of array of BCD bit strings $\operatorname{In}[]$ starting from $\operatorname{In}[0]$ to unsigned integers. It outputs the unsigned integers to unsigned integer array AryOut[].
The following example is for when Size is UINT\#3.

The following table shows the valid ranges for In[] and AryOut[] according to the data types of their elements.

| Data type of the elements of $\ln []$ | Data type of the elements of AryOut[] | Valid range of $\operatorname{In}[]$ | Valid range of AryOut[] |
| :---: | :---: | :---: | :---: |
| BYTE | USINT | 16\#00 to 16\#99 (BCD) | 0 to 99 |
| WORD | UINT | 16\#0000 to 16\#9999 (BCD) | 0 to 9999 |
| DWORD | UDINT | $\begin{aligned} & \text { 16\#0000_0000 to 16\#9999_9999 } \\ & \text { (BCD) } \end{aligned}$ | 0 to 99999999 |
| LWORD | ULINT | 16\#0000_0000_0000_0000 to | 0 to 9999999999999999 |

## Precautions for Correct Use

- Use the same data type and size for In[] and AryOut[]. For example, if the elements of In[] are WORD data, use USINT as the data type of the elements of AryOut[].
- This instruction does not convert signed BCD to signed binary. Use an unsigned integer (USINT, UINT, UDINT, or ULINT) as the data type of AryOut [].
- The values in AryOut[] do not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- The data type sizes of $\operatorname{In}[]$ and AryOut[] are different.
- The value of Size exceeds the array area of In[] or AryOut[].
- A value in $\ln []$ is not a $B C D$ bit string (i.e., contains $A, B, C, D, E$, or $F$ hexadecimal).

## Function

These instructions convert an integer，In，to an integer with a different data type．
The name of the instruction is determined by the data types of In and conversion result Out．For exam－ ple，if $I n$ is INT data and Out is DINT data，the name of the instruction is INT＿TO＿DINT．
The following example for the INT＿TO＿DINT instruction is for when In is INT\＃1234．

LD

The following table shows the valid ranges for In and Out according to their data types.

| $\begin{gathered} \hline \text { Data type } \\ \text { of } \ln \\ \hline \end{gathered}$ | $\begin{aligned} & \text { Data type } \\ & \text { of Out } \end{aligned}$ | Valid range for In and Out |

|  | DINT | -2147483648 to 2147483647 |

## Additional Information

To convert data with any data type to integer data, use a TO_** (Integer Conversion Group) instruction (page 2-277).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If $I n$ is a signed integer and the data size of Out is larger than the data size of $I n$, sign extension is performed.
- If $I n$ is an unsigned integer and the data size of Out is larger than the data size of $I n$, the upper digits of Out will contain 0.
- If the data size of Out is smaller than the data size of $I n$, the upper digits are truncated in Out.

## ＊＊＿TO＿＊＊＊（Integer－to－Bit String Conversion Group）

These instructions convert integers to bit strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿＊＊＊ | Integer－to－Bit String Conversion Group | FUN | ＂＊＊＂must be an integer data type． ＂＊＊＊＂must be a bit string data type． | Out：＝＊＊＿TO＿＊＊＊（In）； <br> must be an integer data type． <br> ＂＊＊＊＂must be a bit string data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver－ <br> sion result | Output | Conversion result | $*$ | --- | --- |

＊The valid ranges depend on the data types of In and Out．Refer to Function，below，for details．

## Function

These instructions convert an integer，In，to a bit string．
The name of the instruction is determined by the data types of In and conversion result Out．For exam－ ple，if $I n$ is INT data and Out is WORD data，the name of the instruction is INT＿TO＿WORD．
The following example for the INT＿TO＿WORD instruction is for when In is INT\＃－1234．

The following table shows the valid ranges for In and Out according to their data types.

| Data type of $\boldsymbol{I n}$ | Data type of Out | Valid range for In | Valid range for Out |
| :---: | :---: | :---: | :---: |
| USINT | BYTE | 0 to 255 | 16\#00 to 16\#FF |
|  | WORD |  |  |
|  | DWORD |  |  |
|  | LWORD |  |  |
| UINT | BYTE | 0 to 255 | 16\#00 to 16\#FF |
|  | WORD | 0 to 65535 | 16\#0000 to 16\#FFFF |
|  | DWORD |  |  |
|  | LWORD |  |  |
| UDINT | BYTE | 0 to 255 | 16\#00 to 16\#FF |
|  | WORD | 0 to 65535 | 16\#0000 to 16\#FFFF |
|  | DWORD | 0 to 4294967295 | 16\#0000_0000 to 16\#FFFF_FFFF |
|  | LWORD |  |  |
| ULINT | BYTE | 0 to 255 | 16\#00 to 16\#FF |
|  | WORD | 0 to 65535 | 16\#0000 to 16\#FFFF |
|  | DWORD | 0 to 4294967295 | 16\#0000_0000 to 16\#FFFF_FFFF |
|  | LWORD | 0 to 18446744073709551645 | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#FFFF_FFFF_FFFF_FFFF } \end{aligned}$ |
| SINT | BYTE | -128 to 127 | 16\#00 to 16\#FF |
|  | WORD |  |  |
|  | DWORD |  |  |
|  | LWORD |  |  |
| INT | BYTE | -128 to 127 | 16\#00 to 16\#FF |
|  | WORD | -32768 to 32767 | 16\#0000 to 16\#FFFF |
|  | DWORD |  |  |
|  | LWORD |  |  |
| DINT | BYTE | -128 to 127 | 16\#00 to 16\#FF |
|  | WORD | -32768 to 32767 | 16\#0000 to 16\#FFFF |
|  | DWORD | -2147483648 to 2147483647 | 16\#0000_0000 to 16\#FFFF_FFFF |
|  | LWORD |  |  |
| LINT | BYTE | -128 to 127 | 16\#00 to 16\#FF |
|  | WORD | -32768 to 32767 | 16\#0000 to 16\#FFFF |
|  | DWORD | -2147483648 to 2147483647 | 16\#0000_0000 to 16\#FFFF_FFFF |
|  | LWORD | $\begin{aligned} & -9223372036854775808 \text { to } \\ & 9223372036854775807 \end{aligned}$ | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#FFFF_FFFF_FFFF_FFFF } \end{aligned}$ |

## Additional Information

- To convert a bit string to an integer, use a **_TO_*** (Bit String-to-Integer Conversion Group) instruction (page 2-239).
- To convert data with any data type to a bit string, use a TO_** (Bit String Conversion Group) instruction (page 2-279).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If $I n$ is a signed integer and the data size of Out is larger than the data size of $I n$, sign extension is performed.
- If $I n$ is an unsigned integer and the data size of Out is larger than the data size of $I n$, the upper digits of Out will contain 0.
- If the data size of Out is smaller than the data size of $I n$, the upper digits are truncated in Out.

## ＊＊＿TO＿＊＊＊（Integer－to－Real Number Conversion Group）

These instructions convert integers to real numbers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿＊＊＊ | Integer－to－Real Number Conversion Group | FUN | ＂＊＊＂must be an integer data type． ＂＊＊＊＂must be a real number data type． | Out:=**_TO_*** (In); <br> must be an integer data type． ＂＊＊＊＂must be a real number data type． |

Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver－ <br> sion result | Output | Conversion result | $*$ | --- | --- |

＊The valid ranges depend on the data types of In and Out．Refer to Function，below，for details．

| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

These instructions convert an integer，In，to a real number．
The name of the instruction is determined by the data types of In and conversion result Out．For exam－ ple，if $I n$ is INT data and Out is REAL data，the name of the instruction is INT＿TO＿REAL．
The following example for the INT＿TO＿REAL instruction is for when In is INT\＃1234．
LD
ST
abc：＝INT＿TO＿REAL（INT\＃1234）；

In

The following table shows the valid ranges for In and Out according to their data types.

| $\begin{gathered} \text { Data type } \\ \text { of } I n \end{gathered}$ | Data type of Out | Valid range for In | Valid range for Out |
| :---: | :---: | :---: | :---: |
| USINT | REAL | 0 to 255 | 0 to $2.55 \mathrm{e}+2$ |
|  | LREAL |  |  |
| UINT | REAL | 0 to 65535 | 0 to $6.5535 \mathrm{e}+4$ |
|  | LREAL |  |  |
| UDINT | REAL | 0 to 4294967295 | 0 to 4.294967e+9 |
|  | LREAL |  | 0 to 4.294967295e+9 |
| ULINT | REAL | 0 to 18446744073709551615 | 0 to $1.844674 \mathrm{e}+19$ |
|  | LREAL |  | 0 to $1.84467440737095 \mathrm{e}+19$ |
| SINT | REAL | -128 to 127 | $-1.28 \mathrm{e}+2$ to $1.27 \mathrm{e}+2$ |
|  | LREAL |  |  |
| INT | REAL | -32768 to 32767 | $-3.2768 \mathrm{e}+4$ to 3.2767e+4 |
|  | LREAL |  |  |
| DINT | REAL | -2147483648 to 2147483647 | -2.147483e+9 to 2.147483e+9 |
|  | LREAL |  | $-2.147483648 \mathrm{e}+9$ to $2.147483647 \mathrm{e}+9$ |
| LINT | REAL | $\begin{aligned} & -9223372036854775808 \text { to } \\ & 9223372036854775807 \end{aligned}$ | -9.223372e+18 to 9.223372e+18 |
|  | LREAL |  | $\begin{aligned} & -9.22337203685477 \mathrm{e}+18 \text { to } \\ & 9.22337203685477 \mathrm{e}+18 \end{aligned}$ |

## Additional Information

- To convert a real number to an integer, use a **_TO_*** (Real Number-to-Integer Conversion Group) instruction (page 2-246).
- To convert data with any data type to a real number, use a TO_** (Real Number Conversion Group) instruction (page 2-281).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- Depending on the data types of In and Out, rounding will be performed for the effective digits of the real number. This will cause error between the values before and after conversion. The following table lists the data types that result in error.

| Data type <br> of $\boldsymbol{I n}$ | Data type <br> of Out | Values for which error occurs |
| :--- | :--- | :--- |
| DINT REAL -16777216 or lower, or 16777216 or higher <br> LINT REAL 16777216 or higher <br> UDINT ULINT RREAL-9007199254740992 or lower, or 9007199254740992 or <br> higher |  |  |
| LINT | ULINT | LREAL | | 9007199254740992 or higher |
| :--- |

## Additional Information

- To convert an integer to a bit string, use a **_TO_*** (Integer-to-Bit String Conversion Group) instruction (page 2-235).
- To convert data with any data type to a bit string, use a TO_** (Bit String Conversion Group) instruction (page 2-279).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If the data size of Out is larger than the data size of $I n$, the upper digits of Out will contain 0 .
- If the data size of Out is smaller than the data size of $I n$, the upper digits are truncated in Out.

## **_TO_*** (Bit String-to-Bit String Conversion Group)

These instructions convert bit strings to bit strings with different data types.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| **_TO_*** | Bit String-to-Bit String Conversion Group | FUN | "**" and "***" must be different bit string data types. | Out:=**_TO_** (In); <br> "**" and "***" must be different bit string data types. |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver- <br> sion result | Output | Conversion result | $*$ | --- | --- |

* The valid ranges depend on the data types of In and Out. Refer to Function, below, for details.

|  |  |  | Bit st | rings |  |  |  |  |  |  |  |  |  |  |  |  | me | dur |  |  |

| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions convert a bit string, In, to a bit string with a different data type.
The name of the instruction is determined by the data types of In and conversion result Out. For example, if In is WORD data and Out is DWORD data, the name of the instruction is WORD_TO_DWORD. The following example for the WORD_TO_DWORD instruction is for when In is WORD\#16\#F123.

LD

In

The following table shows the valid ranges for In and Out according to their data types.

| Data type <br> of $\boldsymbol{I n}$ | Data type <br> of Out | Valid range for In and Out |
| :--- | :--- | :--- |
| BYTE | WORD | $16 \# 00$ to 16\#FF |
|  | DWORD |  |
|  | LWORD |  |
| WORD | BYTE | $16 \# 00$ to $16 \# F F$ |
|  | DWORD | $16 \# 0000$ to $16 \# F F F F$ |
|  | LWORD |  |
| DWORD | BYTE | $16 \# 00$ to $16 \# F F$ |
|  | WORD | $16 \# 0000$ to $16 \# F F F F$ |
|  | LWORD | $16 \# 0000 \_0000$ to $16 \# F F F F \_F F F F$ |
| LWORD | BYTE | $16 \# 00$ to $16 \# F F$ |
|  | WORD | $16 \# 0000$ to $16 \# F F F F$ |
|  | DWORD | $16 \# 0000 \_0000$ to 16\#FFFF_FFFF |

## Additional Information

To convert data with any data type to a bit string, use a TO_** (Bit String Conversion Group) instruction (page 2-279).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If the data size of Out is larger than the data size of $I n$, the upper digits of Out will contain 0 .
- If the data size of Out is smaller than the data size of $I n$, the upper digits are truncated when the data is output to Out.

## ＊＊＿TO＿＊＊＊（Bit String－to－Real Number Conversion Group）

These instructions convert bit strings to real numbers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿＊＊ | Bit String－to－Real Number Conversion Group | FUN | ＂＊＊＂must be a bit string data type． <br> ＂＊＊＊＂must be a real number data type． | Out：＝＊＊＿TO＿＊＊（In）； <br> must be a bit string data type． <br> ＂＊＊＊＂must be a real number data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver－ <br> sion result | Output | Conversion result | $*$ | --- | --- |

＊The valid ranges depend on the data types of In and Out．Refer to Function，below，for details．

## Function

These instructions take a bit string，In，as an unsigned integer of the same size and convert it to a real number．
The name of the instruction is determined by the data types of In and conversion result Out．For exam－ ple，if $I n$ is WORD data and Out is REAL data，the name of the instruction is WORD＿TO＿REAL．
The following example for the WORD＿TO＿REAL instruction is for when In is WORD\＃16\＃8000．

LD

ST
abc：＝WORD＿TO＿REAL（WORD\＃16\＃8000）；

In

The following table shows the valid ranges for In and Out according to their data types.

| Data type of In | Data type of Out | Valid range for In | Valid range for Out |
| :---: | :---: | :---: | :---: |
| BYTE | REAL | 16\#00 to 16\#FF | 0 to $2.55 \mathrm{e}+2$ |
|  | LREAL |  |  |
| WORD | REAL | 16\#0000 to 16\#FFFF | 0 to $6.5535 \mathrm{e}+4$ |
|  | LREAL |  |  |
| DWORD | REAL | 16\#0000_0000 to 16\#FFFF_FFFF | 0 to 4.294967e+9 |
|  | LREAL |  | 0 to 4.294967295e+9 |
| LWORD | REAL | 16\#0000_0000_0000_0000 to 16\#FFFF_FFFF_FFFFF_FFFF | 0 to $1.844674 \mathrm{e}+19$ |
|  | LREAL |  | 0 to $1.84467440737095 \mathrm{e}+19$ |

## Additional Information

- To convert a real number to a bit string, use a **_TO_*** (Real Number-to-Bit String Conversion Group) instruction (page 2-249).
- To convert data with any data type to a real number, use a TO_** (Real Number Conversion Group) instruction (page 2-281).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- Depending on the data types of In and Out, rounding will be performed for the effective digits of the real number. This will cause error between the values before and after conversion. The following table lists the data types that result in error.

| Data type <br> of $\boldsymbol{n} \boldsymbol{n}$ | Data type <br> of $\boldsymbol{O} \boldsymbol{u}$ | Values for which error occurs |
| :--- | :--- | :--- |
| DWORD | REAL | 16\#0100_0000 or higher |
| LWORD | LREAL | $16 \# 0002 \_0000 \_0000 \_0000$ or higher |

## ＊＊＿TO＿＊＊＊（Real Number－to－Integer Conversion Group）

These instructions convert real numbers to integers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿＊＊＊ | Real Number－to－ Integer Conversion Group | FUN | ＂＊＊＂must be a real number data type． ＂＊＊＊＂must be an integer data type． | Out：＝＊＊＿TO＿＊＊（In）； <br> ＂＊＊＂must be a real number data type． <br> ＂＊＊＊＂must be an integer data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver－ <br> sion result | Output | Conversion result | $*$ | --- | --- |

＊The valid ranges depend on the data types of In and Out．Refer to Function，below，for details．

|  | $$ |  | Bit s | ings |  |  |  |  |  |  |  |  |  |  |  |  | mes | dura | st |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 罟 } \end{aligned}$ | $\underset{~}{\text { m }}$ | $\begin{aligned} & \sum_{0}^{1} \\ & \text { D } \end{aligned}$ | 믕 品 | $\begin{aligned} & \hline \sum_{0}^{\prime} \\ & \text { D } \end{aligned}$ | $\sum_{\underset{1}{\infty}}^{\substack{C}}$ | $\underset{\substack{\text { Cl }}}{C}$ | $\underset{\underset{z}{\text { C }}}{\text { C }}$ | $\underset{\underset{1}{c}}{\stackrel{C}{2}}$ | $\sum_{\boldsymbol{Z}}^{\infty}$ | $\bar{z}_{1}$ | $\sum_{1}^{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{y}{2} \end{aligned}$ | $\begin{aligned} & \text { 俍 } \\ & \text { N } \end{aligned}$ | $\frac{-1}{2}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | ō | 막 | 第 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | Ок | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |

## Function

These instructions convert a real number，In，to an integer．
The name of the instruction is determined by the data types of In and conversion result Out．For exam－ ple，if $I n$ is LREAL data and Out is LINT data，the name of the instruction is LREAL＿TO＿LINT．
The following example for the LREAL＿TO＿LINT instruction is for when In is LREAL\＃1．0e +10 ．

LD

ST
abc：＝LREAL＿TO＿LINT（LREAL\＃1．0e＋10）；

In

The fractional part of the value of $I n$ is rounded off to the closest integer. The following table shows how values are rounded.

| Value of <br> fractional <br> part | Treatment | Examples |
| :--- | :--- | :--- |
| Less than The fractional part is truncated. $1.49 \rightarrow 1$ <br> 0.5   | $-1.49 \rightarrow-1$ <br> 0.5 | If the ones digit is an even number, the fractional part <br>  <br> is truncated. If it is an odd number, the value is |
|  | rounded up. | $2.50 \rightarrow 2$ |
|  |  | $-1.50 \rightarrow-2$ |
|  | The fractional part is rounded up. | $-2.50 \rightarrow-2$ |
| Greater | $1.51 \rightarrow 2$ |  |
| than 0.5 |  | $-1.51 \rightarrow-2$ |

The following table shows the valid ranges for In and Out according to their data types.

| Datatype of $I n$ | Data type of Out | Valid range for In | Valid range for Out |
| :---: | :---: | :---: | :---: |
| REAL | USINT | 0 to $2.55 \mathrm{e}+2$ | 0 to 255 |
|  | UINT | 0 to $6.5535 \mathrm{e}+4$ | 0 to 65535 |
|  | UDINT | 0 to 4.294967e+9 | 0 to 4294967295 |
|  | ULINT | 0 to $1.844674 \mathrm{e}+19$ | 0 to 18446744073709551615 |
|  | SINT | $-1.28 \mathrm{e}+2$ to $1.27 \mathrm{e}+2$ | -128 to 127 |
|  | INT | $-3.2768 \mathrm{e}+4$ to 3.2767e+4 | -32768 to 32767 |
|  | DINT | $-2.147483 \mathrm{e}+9$ to 2.147483e+9 | -2147483648 to 2147483647 |
|  | LINT | $-9.223372 \mathrm{e}+18$ to 9.223372e+18 | $\begin{aligned} & -9223372036854775808 \text { to } \\ & 9223372036854775807 \end{aligned}$ |
| LREAL | USINT | 0 to $0.255 \mathrm{e}+3$ | 0 to 255 |
|  | UINT | 0 to $6.5535 \mathrm{e}+4$ | 0 to 65535 |
|  | UDINT | 0 to 4.294967295e+9 | 0 to 4294967295 |
|  | ULINT | 0 to $1.84467440737095 \mathrm{e}+19$ | 0 to 18446744073709551615 |
|  | SINT | $-1.28 \mathrm{e}+2$ to $1.27 \mathrm{e}+2$ | -128 to 127 |
|  | INT | $-3.2768 \mathrm{e}+4$ to $3.2767 \mathrm{e}+4$ | -32768 to 32767 |
|  | DINT | $-2.147483648 \mathrm{e}+9$ to $2.147483647 \mathrm{e}+9$ | -2147483648 to 2147483647 |
|  | LINT | $\begin{aligned} & \hline-9.22337203685477 \mathrm{e}+18 \text { to } \\ & 9.22337203685477 \mathrm{e}+18 \end{aligned}$ | $\begin{aligned} & -9223372036854775808 \text { to } \\ & 9223372036854775807 \end{aligned}$ |

## Additional Information

- To convert an integer to a real number, use an Integer-to-Real Number Conversion Group Instruction.
- To convert data with any data type to an integer, use an Integer Conversion Group Instruction.
- You can use the following instructions to convert a real number to an integer: TRUNC (Truncate), Round (Round Off Real Number), and RoundUp (Round Up Real Number). All of these instructions have a REAL input and DINT output, or a LREAL input and LINT output. The differences between these instructions are shown in the following table.

| Input value | Output value |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | REAL_TO_INT | TRUNC | Round | RoundUp |
| REAL\#1.6 | INT\#2 | DINT\#1 | DINT\#2 | DINT\#2 |
| REAL\#1.5 | INT\#2 | DINT\#1 | DINT\#2 | DINT\#2 |
| REAL\#1.5 | INT\#1 | DINT\#1 | DINT\#1 | DINT\#2 |
| REAL\#2.5 | INT\#2 | DINT\#2 | DINT\#2 | DINT\#3 |
| REAL\#-1.6 | INT\#-2 | DINT\#-1 | DINT\#-2 | DINT\#-2 |
| REAL\#-1.5 | INT\#-2 | DINT\#-1 | DINT\#-2 | DINT\#-2 |
| REAL\#-1.4 | INT\#-1 | DINT\#-1 | DINT\#-1 | DINT\#-2 |
| REAL\#-2.5 | INT\#-2 | DINT\#-2 | DINT\#-2 | DINT\#-3 |

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If the conversion result exceeds the valid range of Out, Out will contain an illegal value.

## ＊＊＿TO＿＊＊＊（Real Number－to－Bit String Conversion Group）

These instructions convert real numbers to bit strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿＊＊＊ | Real Number－to－ Bit String Conver－ sion Group | FUN | ＂＊＊＂must be a real number data type． ＂＊＊＊＊＂must be a bit string data type． | $\begin{aligned} & \text { Out:=**_TO_*** (In); } \\ & \text { "**" must be a real number } \\ & \text { data type. } \\ & \text { "***" must be a bit string } \\ & \text { data type. } \end{aligned}$ |

Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver－ <br> sion result | Output | Conversion result | $*$ | --- | --- |

＊The valid ranges depend on the data types of In and Out．Refer to Function，below，for details．

|  |  |  | Bit st | rings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { imes } \\ & \text { s, an } \end{aligned}$ | dura |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \hline \mathbf{\circ} \end{aligned}$ | $\begin{aligned} & \text { 男 } \\ & \text { n } \end{aligned}$ | $\begin{aligned} & \sum_{0} \\ & \end{aligned}$ | 0 0 0 0 | $\begin{aligned} & \text { 号 } \\ & \text { 召 } \end{aligned}$ | $\underset{\underset{1}{\text { Con }}}{\substack{C}}$ | $\sum_{-1}^{C}$ | $\frac{\sum_{-1}^{C}}{0}$ | $\underset{\underset{\sim}{c}}{\stackrel{C}{c}}$ | $\sum_{-1}^{\infty}$ | Ė | $\sum_{1}^{0}$ | $\sum_{1}^{5}$ | $\begin{aligned} & \underset{\sim}{D} \\ & \stackrel{y}{2} \end{aligned}$ | $\begin{aligned} & \text { 「J } \\ & \stackrel{\pi}{7} \\ & \stackrel{N}{2} \end{aligned}$ | $\frac{-1}{\bar{n}}$ |  | ō | 막 |  |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions convert a real number，In，to a bit string．
The name of the instruction is determined by the data types of In and conversion output Out．For exam－ ple，if $I n$ is LREAL data and Out is DWORD data，the name of the instruction is LREAL＿TO＿DWORD． The following example for the LREAL＿TO＿DWORD instruction is for when In is LREAL\＃6．5536e＋4．

LD

D

ST
abc：＝LREAL＿TO＿DWORD（LREAL\＃6．5536e＋4）；

Conversion is performed using the following procedure.
1
The fractional part of the value of $I n$ is rounded off to the closest integer as described below.
2 The resulting integer is taken as an unsigned integer and output as a bit string.
The following table shows how values are rounded.

| Value of fractional part | Treatment | Examples |
| :---: | :---: | :---: |
| $\begin{aligned} & \hline \text { Less than } \\ & 0.5 \end{aligned}$ | The fractional part is truncated. | $\begin{aligned} & \hline 1.49 \rightarrow 1 \\ & -1.49 \rightarrow-1 \end{aligned}$ |
| 0.5 | If the ones digit is an even number, the fractional part is truncated. If it is an odd number, the value is rounded up. | $\begin{aligned} & 1.50 \rightarrow 2 \\ & 2.50 \rightarrow 2 \\ & -1.50 \rightarrow-2 \\ & -2.50 \rightarrow-2 \end{aligned}$ |
| Greater than 0.5 | The fractional part is rounded up. | $\begin{aligned} & 1.51 \rightarrow 2 \\ & -1.51 \rightarrow-2 \end{aligned}$ |

The following table gives some conversion examples.

| Value of <br> In | Integer | Value of <br> Out |
| :--- | :--- | :--- |
| 1.6 | 2 | $16 \# 0002$ |
| 3.5 | 4 | $16 \# 0004$ |
| -1.6 | -2 | $16 \#$ FFFE |

The following table shows the valid ranges for In and Out according to their data types.

| Data type of In | Data type of Out | Valid range for In | Valid range for Out |
| :---: | :---: | :---: | :---: |
| REAL | BYTE | $-1.285999 \mathrm{e}+2$ to $1.274999 \mathrm{e}+2$ | 16\#00 to 16\#FF |
|  | WORD | $-3.276859 \mathrm{e}+4$ to 3.276749e+4 | 16\#0000 to 16\#FFFF |
|  | DWORD | -2.147483e+9 to 2.147483e+9 | 16\#0000_0000 to 16\#FFFF_FFFF |
|  | LWORD | $-9.223372 e+18$ to $9.223372 e+18$ | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#FFFF_FFEE_FFFF_FFFF } \end{aligned}$ |
| LREAL | BYTE | $\begin{aligned} & \hline-1.28599999999999 \mathrm{e}+2 \text { to } \\ & 1.27499999999999 \mathrm{e}+2 \end{aligned}$ | 16\#00 to 16\#FF |
|  | WORD | $\begin{aligned} & -3.27685999999999 \mathrm{e}+4 \text { to } \\ & 3.27674999999999 \mathrm{e}+4 \end{aligned}$ | 16\#0000 to 16\#FFFF |
|  | DWORD | $\begin{aligned} & -2.14748364859999 \mathrm{e}+9 \text { to } \\ & 2.14748364749999 \mathrm{e}+9 \\ & \hline \end{aligned}$ | 16\#0000_0000 to 16\#FFFF_FFFF |
|  | LWORD | $\begin{array}{\|l} \hline-9.22337203685477 \mathrm{e}+18 \text { to } \\ 9.223372036854777 \mathrm{e}+18 \\ \hline \end{array}$ | $\begin{aligned} & \text { 16\#0000_0000_0000_0000 to } \\ & \text { 16\#FFFF_FFFF_FFFF_FFFF } \end{aligned}$ |

## Additional Information

To convert a bit string to a real number, use a **_TO_*** (Bit String-to-Real Number Conversion Group) instruction (page 2-244).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If the conversion result exceeds the valid range of Out, Out will contain an illegal value.

## ＊＊＿TO＿＊＊＊（Real Number－to－Real Number Conversion Group）

These instructions convert real numbers to real numbers with different data types．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿＊＊＊ | Real Number－to－ Real Number Con－ version Group | FUN | ＂＊＊＂and＂＊＊＊＂must be different real number data types． | Out：＝＊＊＿TO＿＊＊＊（In）； <br> and＂＊＊＊＂must be dif－ ferent real number data types． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | $*$ | --- | 0 |
| Out | Conver－ <br> sion result | Output | Conversion result | $*$ | --- | --- |

＊The valid ranges depend on the data types of In and Out．Refer to Function，below，for details．

|  | O <br> 0 <br> $\underline{0}$ <br> O |  | t | ngs |  |  |  |  | Inte |  |  |  |  |  |  |  | me | dur | ion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { D } \\ & \text { 군 } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \text { K } \\ & \text { 另 } \\ & \text { D } \end{aligned}$ | $\underset{\underset{Z}{\infty}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\underset{\substack{0}}{\text { C }}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\underset{-1}{\infty}$ | $\bar{z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{2} \end{aligned}$ |  | 긏 | 号 | －1 | 먹 | 号 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

These instructions convert a real number，In，to a real number with a different data type．
The name of the instruction is determined by the data types of In and conversion result Out．For exam－ ple，if $I n$ is REAL data and Out is LREAL data，the name of the instruction is REAL＿TO＿LREAL．
The following example for the REAL＿TO＿LREAL instruction is for when In is REAL\＃3．141592e＋0．

LD

ST
abc：＝REAL＿TO＿LREAL（REAL\＃3．141592e＋0）；

The following table shows the valid ranges for In and Out according to their data types.

| Data type of $\boldsymbol{I n}$ | Data type of Out | Valid range for In and Out |
| :--- | :--- | :--- |
| REAL | LREAL | $-3.402823 \mathrm{e}+38$ to $3.402823 \mathrm{e}+38$ |
| LREAL | REAL | or $+\infty /-\infty$ |

## Additional Information

To convert data with any data type to a real number, use a TO_** (Real Number Conversion Group) instruction (page 2-281).

## Precautions for Correct Use

- Always use the correct instruction name for the data types of In and Out.
- If the value of $I n$ is positive or negative infinity, the value of Out is positive or negative infinity.
- If the value of $I n$ is nonnumeric data, the value of Out is nonnumeric data.
- If the conversion result exceeds the valid range of Out, the value of Out will be infinity with the same sign as the value of $I n$.
- For the LREAL_TO_REAL instruction, if the value of $I n$ is closer to 0 than $\pm 1.175494 \mathrm{e}-38$, the value of Out will be 0 .

## ＊＊＿TO＿STRING（Integer－to－Text String Conversion Group）

These instructions convert integers to text strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿STRING | Integer－to－Text String Conversion Group | FUN | ＂＊＊＂must be an integer data type． | Out：＝＊＊＿TO＿STRING（In）； $\qquad$ must be an integer data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | Depends on data type． | --- | 0 |
| Out | Conver－ <br> sion result | Output | Conversion result | $*$ | --- | --- |

＊The valid range depends on the data type of $I n$ ．Refer to Function for details．

|  | 0 0 $\frac{0}{0}$ $\stackrel{\sim}{3}$ |  | s | gs |  |  |  |  | Inte | ers |  |  |  |  |  |  |  | du |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 品 | $\begin{aligned} & \text { ロ⿴囗㐅㐅木号 } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\Gamma$ 0 0 0 0 | ${\underset{Z}{2}}_{\substack{C}}$ | $\underset{-1}{\underset{\sim}{C}}$ | $\frac{\text { 든 }}{2}$ | $\stackrel{\underset{1}{C}}{\stackrel{\rightharpoonup}{2}}$ | ${\underset{Z 1}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{2}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \mathbb{D} \\ & \stackrel{\pi}{\$} \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \text { I } \end{aligned}$ | $\stackrel{-1}{3}$ | 号 | － | 먹 | 禹 |
| In |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

These instructions convert an integer，In，to a text string．The number given in $I n$ is output to conversion result Out as a text string．A NULL character（16\＃00）is placed at the end of Out．
The text in Out is left－aligned．If the value in In requires fewer digits than provided by the data type of In， zeros will not be output to the upper digits of Out．In other words，leading zeros are suppressed．If In contains a negative value，a minus sign（－）is added to the front of the text string．
The name of the instruction is determined by the data type of $I n$ ．For example，if $I n$ is the INT data type， the instruction is INT＿TO＿STRING．

The following example for the INT_TO_STRING instruction is for when In is INT\#1234.

The valid range of Out depends on the data type of In as shown below:

| Data type of $\boldsymbol{I n}$ | Valid range of Out (maximum number of bytes) |
| :--- | :--- |
| USINT | 4 bytes (three single-byte alphanumeric characters plus the <br> final NULL character) |
| UINT | 6 bytes (five single-byte alphanumeric characters plus the final <br> NULL character) |
| UDINT | 11 bytes (10 single-byte alphanumeric characters plus the final <br> NULL character) |
| ULINT | 21 bytes (20 single-byte alphanumeric characters plus the final <br> NULL character) |
| SINT | 5 bytes (four single-byte alphanumeric characters plus the final <br> NULL character) |
| INT | 7 bytes (six single-byte alphanumeric characters plus the final <br> NULL character) |
| DINT | 12 bytes (11 single-byte alphanumeric characters plus the final <br> NULL character) |
| LINT | 21 bytes (20 single-byte alphanumeric characters plus the final <br> NULL character) |

## Additional Information

To convert a text string number to an integer, use a STRING_TO_** (Text String-to-Integer Conversion Group) instruction (page 2-270).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of In.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The number of bytes in the conversion result exceeds the size of the output parameter that is connected to Out.

## ＊＊＿TO＿STRING（Bit String－to－Text String Conversion Group）

These instructions convert bit strings to text strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿STRING | Bit String－to－Text String Conversion Group | FUN | ＂＊＊＂must be a bit string data type． | Out：＝＊＊＿TO＿STRING（In）； must be a bit string data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | Depends on data type． | --- | 0 |
| Out | Conver－ <br> sion result | Output | Conversion result | $*$ | --- | --- |

## Function

These instructions convert a bit string，In，to a text string．The hexadecimal number given in In is output to conversion result Out as a text string．The \＃16 prefix of the hexadecimal number is not output to Out． A NULL character（16\＃00）is placed at the end of Out．
The text in Out is left－aligned．If the value in In requires fewer digits than provided by the data type of In， the upper digits of Out will contain 0 ．In other words，the unused digits are padded with zeros．The num－ ber of bytes in Out（including the NULL character）will always be one greater than twice the number of bytes in In．
The name of the instruction is determined by the data type of $I n$ ．For example，if $I n$ is the WORD data type，the instruction is WORD＿TO＿STRING．

The following example for the WORD_TO_STRING instruction is for when In is WORD\#16\#1F.

The valid range of Out depends on the data type of In as shown below:

| Data type of $\boldsymbol{I n}$ | Valid range of Out (maximum number of bytes) |
| :--- | :--- |
| BYTE | 3 bytes (two single-byte alphanumeric characters plus the <br> final NULL character) |
| WORD | 5 bytes (four single-byte alphanumeric characters plus <br> the final NULL character) |
| DWORD | 9 bytes (eight single-byte alphanumeric characters plus <br> the final NULL character) |
| LWORD | 17 bytes (16 single-byte alphanumeric characters plus <br> the final NULL character) |

## Additional Information

To convert In to a signed text string, first convert it to a signed integer using a **_TO_*** (Bit String-toInteger Conversion Group) instruction (page 2-239) and then use a **_TO_STRING (Integer-to-Text String Conversion Group) instruction (page 2-253).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of In.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The number of bytes in the conversion result exceeds the size of the output parameter that is connected to Out.

## ＊＊＿TO＿STRING（Real Number－to－ Text String Conversion Group）

These instructions convert real numbers to text strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ＊＊＿TO＿STRING | Real Number－to－ Text String Conver－ sion Group | FUN | ＂＊＊＊＂must be a real number data type． | Out：＝＊＊＿TO＿STRING（In）； ＂＊＊＂must be a real number data type． |

Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :---: | :--- | :--- | :--- | :--- |
| In | Data to con－ <br> vert | Input | Data to convert | Depends on <br> data type． | --- | 0.0 |
| Out | Conversion <br> result | Output | Conversion result | $*$ | --- | --- |

＊The valid range depends on the data type of $I n$ ．Refer to Function for details．

|  | $$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |

|  | $\begin{aligned} & \text { © } \\ & \text { O } \\ & \text { ㅇ } \end{aligned}$ | $\begin{aligned} & \text { ロ } \\ & \text { 子 } \end{aligned}$ | $\begin{aligned} & \sum_{0} \\ & \text { D } \end{aligned}$ | 0 $\sum_{0}^{0}$ D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O } \end{aligned}$ | $\sum_{-1}^{C}$ | $\underset{\substack{C}}{\subseteq}$ | $\underset{\sim}{\text { 득 }}$ | $\underset{\underset{1}{C}}{\stackrel{C}{E}}$ | $\underset{-1}{\infty}$ | $\underline{\Sigma}$ | ${\underset{Z}{2}}_{\text {믄 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { 而 } \\ & \stackrel{2}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 而 } \\ & \hline \end{aligned}$ | $\begin{aligned} & -1 \\ & \hline 1 \\ & \hline 1 \end{aligned}$ | $\begin{aligned} & \text { 밀 } \\ & \hline 1 \end{aligned}$ | －1 | 먹 |  |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

These instructions convert a real number，In，to a text string．In is expressed as an alphanumeric text string and output to conversion result Out．
The format of Out is as follows：

| Item | Description |
| :--- | :--- |
| Sign column | If $\operatorname{In}$ contains a negative value, a minus sign ( -$)$ is added. <br> If $\operatorname{In}$ contains a positive value, a plus sign $(+)$ is not added. |
| Integer part | The integer part is always only one digit. |
| Decimal point | The decimal point is always given even if In is not a decimal number. |
| Fractional part | If In is REAL data, 6 digits are given. If $\operatorname{In}$ is LREAL data, 14 digits are given. |
| Exponent | The exponent is always given. "nn" is 2 or 3 digits. <br> The sign of "nn" is positive $(+)$ if the absolute value of $I n$ is 1.0 or higher and <br> negative $(-)$ if it is less than 1.0. |

A NULL character (16\#00) is placed at the end of Out.
The name of the instruction is determined by the data type of $I n$. For example, if $I n$ is the REAL data type, the instruction is REAL_TO_STRING.
The following example shows the REAL_TO_STRING instruction when In is REAL\#-1234.567.
LD

If the value of $I n$ is 0 , infinity, or nonnumeric data, the value of Out is as shown below.

| Value of $\boldsymbol{I n}$ | Value of Out |
| :--- | :--- |
| 0 | 0 |
| $+\infty$ | inf |
| $-\infty$ | - inf |
| Nonnumeric data | 'nan' or '-nan' |

## Additional Information

- To convert a text string to a real number, use a STRING_TO_** (Text String-to-Real Number Conversion Group) instruction (page 2-274).
- To specify the format when you convert a real number to a text string, use the RealToFormatString instruction (page 2-259) or the LrealToFormatString instruction (page 2-264).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of In.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The number of bytes in the conversion result exceeds the size of the output parameter that is connected to Out.

## RealToFormatString

The RealToFormatString instruction converts a REAL variable to a text string with the specified format.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| RealToFormatString | REAL-to-Formatted Text String | FUN |  | Out:=RealToFormatString(In, Exponent, Sign, MinLen, DecPlace); |

## Variables

| Name | Meaning | 1/0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Sign | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| MinLen |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| DecPlace |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The RealToFormatString instruction converts REAL variable In to a text string. In is expressed as an alphanumeric text string and output to conversion result Out. A NULL character (16\#00) is placed at the end of Out.

If In contains a negative value, a minus sign ( - ) is added to the front of the text string. If In contains a positive value, a plus sign ( + ) is not added to the front of the text string.
The format of Out is determined by exponent Exponent, sign column Sign, minimum number of digits MinLen, and precision DecPlace.

| Input variable | Description |
| :--- | :--- |
| Exponent | Exp specifies whether an exponent is given. <br> TRUE: Exponent <br> FALSE: No exponent |
| Sign | Sign specifies whether there is a sign column. <br> TRUE: Sign column <br> FALSE: No sign column <br> The sign column is used only for a minus sign (-). If the number is positive when the sign <br> column is specified, the sign column will contain a blank character. If the number is nega- <br> tive when no sign column is specified, a minus sign (-) will be added to the front of the inte- <br> ger part. <br> However, if the number of digits in the conversion result exceeds the value of MinLen and <br> the conversion result is positive, the highest digit is placed in the sign column. |
| MinLen | MinLen is the minimum number of total digits for the sign column, integer part, decimal <br> point, fractional part, and exponent. <br> If the conversion result has fewer digits than the value of MinLen, the text string will be <br> right-aligned (except for the sign column) and remaining digits will contain blank charac- <br> ters. If the number of digits in the conversion result exceeds the value of MinLen, the text <br> string is left-aligned and the text string for the digits that exceed the value of MinLen is <br> assigned to Out. |
| DecPlace | DecPlace is the number of digits in the fractional part. <br> If the number of digits exceeds the value of DecPlace, the extra digits in the fractional por- <br> tion are rounded off as described below. If the value of DecPlace is 0, the fractional part <br> and decimal point are not given. |

The following examples show the relationships between the values of the input variables and the value of Out when In is REAL\#-1234.567.

Example 1: Exponent: FALSE<br>Sign: FALSE<br>MinLen: USINT\#16<br>DecPlace: USINT\#10

Here, no sign column is specified for a negative number, so a minus sign (-) is added to the front of the integer part.
LD

ST

abc:=RealToFormatString(REAL\#-1234.567, FALSE, FALSE, USINT\#16, USINT\#10);

Example 2: Exponent: TRUE
Sign: FALSE
MinLen: USINT\#21
DecPlace: USINT\#10
Here, the value of MinLen exceeds the number of digits in the text string, so the text string is rightaligned and blank characters are added before it.

Example 3: Exponent: TRUE
Sign: TRUE
MinLen: USINT\#22
DecPlace: USINT\#10
The sign column is always on the left. Blank characters are added to the front of the integer part.

## Example 4: Exponent: TRUE <br> Sign: TRUE <br> MinLen: USINT\#12 <br> DecPlace: USINT\#3

The fourth decimal place is rounded off because DecPlace is USINT\#3.

Example 5: Exponent: TRUE
Sign: TRUE
MinLen: USINT\#12
DecPlace: USINT\#0
The first decimal place is rounded off because DecPlace is USINT\#0. The decimal point is also not given.

Example 6: Exponent: FALSE
Sign: TRUE
MinLen: USINT\#8
DecPlace: USINT\#0
Here, no exponent is given and the integer part is only four digits. The first decimal place is rounded off.

Example 7: Exponent: FALSE
Sign: TRUE
MinLen: USINT\#2
DecPlace: USINT\#0
Here, the number of digits in the integer part of $\ln$ (four digits) is larger than the value of MinLen (USINT\#2). The four digits of the integer part are given.

The following examples show the relationships between the values of the input variables and the value of Out when In is REAL\#123456.7.

Example 8: Exponent: FALSE
Sign: TRUE
MinLen: USINT\#4
DecPlace: USINT\#O
Here, the number of digits in the integer part of In (six digits) is larger than the value of MinLen (USINT\#4). The six digits of the integer part are given. The value of $I n$ is positive, so the highest digit is placed in the sign column.

If the value of $I n$ is positive infinity, the value of Out is 'Inf'. If the value of $I n$ is negative infinity, the value of Out is '-Inf'. If the value of $I n$ is nonnumeric data, the value of Out is "-nan".
If the value of $I n$ is infinity, or nonnumeric data, the value of Out is as shown below.

| Value of In | Value of Out |
| :--- | :--- |
| $+\infty$ | 'inf' |
| $-\infty$ | '-inf'' |
| Nonnumeric data | 'nan' or '-nan'' |

The following table shows how values are rounded.

| Value of <br> fractional <br> part | Treatment | Examples |
| :--- | :--- | :--- |
| Less than <br> 0.5 | The fractional part is truncated. | $1.49 \rightarrow 1$ |
| 0.5 | If the ones digit is an even number, the fractional part <br> is truncated. If it is an odd number, the value is <br> rounded up. | $1.50 \rightarrow 2$ <br> $2.50 \rightarrow 2$ |
| Greater <br> than 0.5 | The fractional part is rounded up. | $1.51 \rightarrow 2$ |

## Additional Information

- Exponent, Sign, MinLen, and DecPlace can be omitted. The defaults are applied for any omitted input variables.
- To convert a LREAL variable to a text string, use the LrealToFormatString instruction (page 2-264).
- To convert a text string to a real number, use a STRING_TO_** (Text String-to-Real Number Conversion Group) instruction (page 2-274).

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- The value of DecPlace is outside of the valid range.
- The value of DecPlace is greater than the value of MinLen.
- The number of bytes in the conversion result exceeds the size of the output parameter that is connected to Out.

## LrealToFormatString

The LrealToFormatString instruction converts a LREAL variable to a text string with the specified for－ mat．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| LrealToFormat－ String | LREAL－to－Format－ ted Text String | FUN |  | Out：＝LrealToFormat－ String（In，Exponent，Sign， MinLen，DecPlace）； |

## Function

The LrealToFormatString instruction converts LREAL variable In to a text string. In is expressed as an alphanumeric text string and output to conversion result Out. A NULL character (16\#00) is placed at the end of Out.
If In contains a negative value, a minus sign (-) is added to the front of the text string. If In contains a positive value, a plus sign (+) is not added to the front of the text string.
The format of Out is determined by exponent Exponent, sign column Sign, minimum number of digits MinLen, and precision DecPlace.

| Input variable | Description |
| :--- | :--- |
| Exponent | Exp specifies whether an exponent is given. <br> TRUE: Exponent <br> FALSE: No exponent |
| Sign | Sign specifies whether there is a sign column. <br> TRUE: Sign column <br> FALSE: No sign column <br> The sign column is used only for a minus sign (-). If the number is positive when the sign <br> column is specified, the sign column will contain a blank character. If the number is nega- <br> tive when no sign column is specified, a minus sign (-) will be added to the front of the inte- <br> ger part. <br> However, if the number of digits in the conversion result exceeds the value of MinLen and <br> the conversion result is positive, the highest digit is placed in the sign column. |
| MinLen | MinLen is the minimum number of total digits for the sign column, integer part, decimal <br> point, fractional part, and exponent. <br> If the conversion result has fewer digits than the value of MinLen, the text string will be <br> right-aligned (except for the sign column) and remaining digits will contain blank charac- <br> ters. If the number of digits in the conversion result exceeds the value of MinLen, the text <br> string is left-aligned and the text string for the digits that exceed the value of MinLen is <br> assigned to Out. |
| DecPlace is the number of digits in the fractional part. <br> If the number of digits exceeds the value of DecPlace, the extra digits in the fractional por- <br> tion are rounded off as described below. If the value of DecPlace is 0, the fractional part <br> and decimal point are not given. |  |

The following examples show the relationships between the values of the input variables and the value of Out when In is LREAL\#-1234.56789.

Example 1: Exponent: FALSE
Sign: FALSE
MinLen: USINT\#16
DecPlace: USINT\#10

Here, no sign column is specified for a negative number, so a minus sign (-) is added to the front of the integer part.

LD

ST
abc:=LrealToFormatString(LREAL\#-1234.56789, FALSE, FALSE, USINT\#16, USINT\#10);

Example 2: Exponent: TRUE
Sign: FALSE
MinLen: USINT\#21
DecPlace: USINT\#10
Here, the value of MinLen exceeds the number of digits in the text string, so the text string is rightaligned and blank characters are added before it.

Example 3: Exponent: TRUE
Sign: TRUE
MinLen: USINT\#22
DecPlace: USINT\#10
The sign column is always on the left. Blank characters are added to the front of the integer part.

$\begin{aligned} \text { Example 4: } & \text { Exponent: TRUE } \\ & \text { Sign: TRUE } \\ & \text { MinLen: USINT\#12 } \\ & \text { DecPlace: USINT\#3 }\end{aligned}$
The fourth decimal place is rounded off because DecPlace is USINT\#3.

Example 5: Exponent: TRUE
Sign: TRUE
MinLen: USINT\#12
DecPlace: USINT\#0
The first decimal place is rounded off because DecPlace is USINT\#O. The decimal point is also not given.

Example 6: Exponent: FALSE
Sign: TRUE
MinLen: USINT\#8
DecPlace: USINT\#O
Here, no exponent is given and the integer part is only four digits. The first decimal place is rounded off.

## Example 7: Exponent: FALSE

Sign: TRUE
MinLen: USINT\#2
DecPlace: USINT\#0
Here, the number of digits in the integer part of In (four digits) is larger than the value of MinLen (USINT\#2). The four digits of the integer part are given.

The following examples show the relationships between the values of the input variables and the value of Out when In is LREAL\#123456.789.

Example 8: Exponent: FALSE
Sign: TRUE
MinLen: USINT\#4
DecPlace: USINT\#0
Here, the number of digits in the integer part of In (six digits) is larger than the value of MinLen (USINT\#4). The six digits of the integer part are given. The value of $I n$ is positive, so the highest digit is placed in the sign column.

If the value of $I n$ is positive infinity, the value of Out is 'Inf'. If the value of $I n$ is negative infinity, the value of Out is '-Inf'. If the value of $I n$ is nonnumeric data, the value of Out is "-nan".
If the value of In is infinity, or nonnumeric data, the value of Out is as shown below.

| Value of In | Value of Out |
| :--- | :--- |
| $+\infty$ | 'inf' |
| $-\infty$ | '-inf' |
| Nonnumeric data | 'nan' or '-nan' |

2 Instruction Descriptions

The following table shows how values are rounded.

| Value of <br> fractional <br> part | Treatment | Examples |
| :--- | :--- | :--- |
| Less than <br> 0.5 | The fractional part is truncated. | $1.49 \rightarrow 1$ |
| 0.5 | If the ones digit is an even number, the fractional part <br> is truncated. If it is an odd number, the value is <br> rounded up. | $1.50 \rightarrow 2$ <br> $2.50 \rightarrow 2$ |
| Greater <br> than 0.5 | The fractional part is rounded up. | $1.51 \rightarrow 2$ |

## Additional Information

- Exponent, Sign, MinLen, and DecPlace can be omitted. The defaults are applied for any omitted input variables.
- To convert a REAL variable to a text string, use the RealToFormatString instruction (page 2-259).
- To convert a text string to a real number, use a STRING_TO_** (Text String-to-Real Number Conversion Group) instruction (page 2-274).

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- The value of DecPlace is outside of the valid range.
- The value of DecPlace is greater than the value of MinLen.
- The number of bytes in the conversion result exceeds the size of the output parameter that is connected to Out.

## STRING＿TO＿＊＊（Text String－to－ Integer Conversion Group）

These instructions convert text strings to integers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| STRING＿TO＿＊＊ | Text String－to－Inte－ ger Conversion Group | FUN | ＂＊＊＂must be an integer data type． | Out:=STRING_TO_* (In); <br> ＂＊＊＂must be an integer data type． |

| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |

## Function

These instructions convert a text string，In，to an integer．
Basically，the text string in In must consist only of numbers 0 to 9 ．The following exceptions are possi－ ble．
－If the first character in $I n$ is a single minus sign（－）or a single plus sign（＋），it is processed as the sign．
－Any blank characters at the beginning of $I n$ are ignored．
－Any blank characters between an initial minus sign（－）or plus sign（＋）and a number are ignored．
－Any single underbars（＇＿＇）at any location are ignored．
－An error occurs if there are two or more consecutive underbars（＇＿＇）at any location．
－An error occurs if there are any underbars（＇＿＇）at the beginning or end．
－An error occurs if there are any underbars（＇$\quad$＇）between the minus signs（＇－＇）or plus sign（＇＋＇）and the number at the beginning．
The name of the instruction is determined by the data type of conversion result Out．For example，if Out is the DINT data type，the instruction is STRING＿TO＿DINT．

The following example for the STRING_TO_DINT instruction is for when In is '123456789'.

The valid range of $I n$ depends on the data type of Out as shown below:

| Data type of Out | Valid range of In (maximum number of bytes)* |
| :--- | :--- |
| USINT | 4 bytes (three single-byte alphanumeric characters plus the <br> final NULL character) |
| UINT | 6 bytes (five single-byte alphanumeric characters plus the final <br> NULL character) |
| UDINT | 11 bytes (10 single-byte alphanumeric characters plus the final <br> NULL character) |
| ULINT | 21 bytes (20 single-byte alphanumeric characters plus the final <br> NULL character) |
| SINT | 5 bytes (four single-byte alphanumeric characters plus the final <br> NULL character) |
| INT | 7 bytes (six single-byte alphanumeric characters plus the final <br> NULL character) |
| DINT | 12 bytes (11 single-byte alphanumeric characters plus the final <br> NULL character) |
| LINT | 21 bytes (20 single-byte alphanumeric characters plus the final <br> NULL character) |

* Any blank characters (' ') at the beginning of the text string, any zeros at the beginning of the text string, and any underbars (' $\quad$ ') in the text string are not included in the number of bytes.

## Additional Information

- To convert a text string to a hexadecimal number, use a STRING_TO_** (Text String-to-Bit String Conversion Group) instruction (page 2-272).
- To convert an integer to a text string, use a **_TO_STRING (Integer-to-Text String Conversion Group) instruction (page 2-253).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of Out.
- If the value of $I n$ is ' -0 ', the value of Out is 0 .
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The text string in In does not express a number.
- The conversion result exceeds the valid range of the data type of Out.
- The text string in In does not end in a NULL character.

## STRING_TO_** (Text String-to-Bit String Conversion Group)

These instructions convert text strings to bit strings.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| STRING_TO_** | Text String-to-Bit String Conversion Group | FUN | "**" must be a bit string data type. | Out:=STRING_TO_** (In); <br> "***" must be a bit string data type. |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | * |  |  |
| Out | Conver- <br> sion result | Output | Conversion result | Depends on data type. | --- | --- |

* The valid range depends on the data type of Out. Refer to Function for details.

|  |  |  | Bit s | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \text { ar } \end{aligned}$ | $\begin{aligned} & \text { dur: } \\ & \text { d tex } \end{aligned}$ | st | gs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O <br> O <br> O | $\begin{aligned} & \text { 䍗 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum_{0} \\ & \text { D } \end{aligned}$ | 믕 O D | $\sum$ $\sum_{0}^{0}$ D | ${\underset{Z}{C}}_{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | 들 | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\sum_{\underset{1}{\prime}}^{\infty}$ | $\underset{-1}{ }$ | ${\underset{Z}{2}}_{\text {민 }}$ | $\sum_{-1}$ | $\begin{aligned} & \text { D } \\ & \text { m } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \underset{\sim}{m} \\ & \stackrel{y}{2} \end{aligned}$ | $\frac{-1}{3}$ | 号 | 응 | 막 | 0 7 0 0 0 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions interpret the content of a text string, In, as a hexadecimal number and convert it to a bit string.
Basically, the text string in In must consist only of ' 0 ' to ' 9 ', ' $a$ ' to ' $f$ ', and ' $A$ ' to ' $F$ '. The following exception is possible.

- Any continuous blank characters or zeros at the beginning of In are ignored.
- Any single underbars ('_') at any location are ignored.
- An error occurs if there are two or more consecutive underbars (' $\quad$ ') at any location.
- An error occurs if there are any underbars ('_') at the beginning or end.
- An error occurs if there are any underbars (' $\quad$ ') between the minus signs ('-') or plus sign (' + ') and the number at the beginning.
The name of the instruction is determined by the data type of conversion result Out. For example, if Out is the BYTE data type, the instruction is STRING_TO_BYTE.

The following example for the STRING_TO_BYTE instruction is for when In is ' AB'. Any blank characters at the beginning are ignored.

The valid range of In depends on the data type of Out as shown below:

| Data type of Out | Valid range of $\boldsymbol{I n}$ (maximum number of bytes)* |
| :--- | :--- |
| BYTE | 3 bytes (two single-byte alphanumeric characters plus the <br> final NULL character) |
| WORD | 5 bytes (four single-byte alphanumeric characters plus the <br> final NULL character) |
| DWORD | 9 bytes (eight single-byte alphanumeric characters plus <br> the final NULL character) |
| LWORD | 17 bytes (16 single-byte alphanumeric characters plus the <br> final NULL character) |

[^7]
## Additional Information

- To treat a signed number as a text string, use a STRING_TO_** (Text String-to-Integer Conversion Group) instruction (page 2-270).
- To convert a bit string to a text string, use a **_TO_STRING (Bit String-to-Text String Conversion Group) instruction (page 2-255).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of Out.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The text string in In does not express a number.
- The conversion result exceeds the valid range of the data type of Out.
- The text string in In does not end in a NULL character.

## STRING＿TO＿＊＊（Text String－to－ Real Number Conversion Group）

These instructions convert text strings to real numbers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| STRING＿TO＿＊＊ | Text String－to－Real Number Conversion Group | FUN | ＂＊＊＂must be a real number data type． | Out:=STRING_TO_* (In); <br> ＂＊＊＂must be a real number data type． |

## Variables

|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 四 } \\ & \text { min } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { D } \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 「 O J | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\substack{C}}{C}$ | $\frac{\text { C }}{\underset{Z}{2}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{Z}{2}}_{0}$ | $\sum_{-1}$ | $\begin{aligned} & \text { D } \\ & \stackrel{N}{\mathbb{2}} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \text { r } \end{aligned}$ | $\begin{aligned} & \text { 길 } \\ & \frac{1}{n} \end{aligned}$ | $\begin{aligned} & \text { 밀 } \\ & \hline 1 \end{aligned}$ | 음 | 막 | 0 7 0 0 0 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

These instructions convert a text string，In，to a real number．
The name of the instruction is determined by the data type of conversion result Out．For example，if Out is the LREAL data type，the instruction is STRING＿TO＿LREAL．
The format of the text sting in In is given below．

| Name | Format |
| :--- | :--- |
| Sign | - Any consecutive blank characters at the beginning of the text string are ignored. Any follow- <br> ing single plus or minus sign is treated as the sign. <br> - The plus sign can be omitted. <br> - Any consecutive blank characters after the sign are ignored. |
| Integer part | - The characters after the sign and up to the decimal point are taken as the integer part. Any <br> consecutive blank characters after the sign are not included in the integer part. The sign may <br> sometimes be omitted. |
| - If the decimal point and fractional part are omitted, the characters up to the exponent are |  |
| taken as the integer part. |  |
| - If the decimal point, fractional part, and exponent are omitted, the characters up to the end |  |
| of the text string are taken as the integer part. |  |
| - The integer part consists of ' 0 ' to ' 9 '. |  |

Example 1: The following example uses the sign, decimal point, and fractional part, but does not use an exponent.

Example 2: The following example uses the sign, decimal point, fractional part, and exponent.

Example 3: The following example does not use the sign, but uses the decimal point, fractional part, and exponent.

Example 4: The following example does not use the sign, fractional part, decimal point, and exponent.

If the value of $I n$ is ' $+\operatorname{Inf}$ ', the value of Out is positive infinity. If the value of $I n$ is ' $-\operatorname{Inf}$ ', the value of Out is negative infinity. In either case, characters are not case sensitive.

## Additional Information

To convert a real number to a text string, use a **_TO_STRING (Real Number-to-Text String Conversion Group) instruction (page 2-257).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of Out.
- Any single underbars ('_') at any location in In are ignored.
- An error occurs if there are any underbars ('_') at the beginning or end of $I n$.
- An error occurs if there are two or more consecutive underbars (' $\quad$ ') at any location in In.
- An error occurs if there are any underbars (' $\quad$ ') between the minus signs ('-') or plus sign ('+') and the number at the beginning of $I n$.
- If the content of In exceeds the precision of the data type of Out, the value is rounded.
- If the content of $I n$ is closer to 0 than the minimum value of the data type of Out, the value of Out will be 0 .
- If the content of In exceeds the valid range of Out, Out will be positive infinity for a positive number or negative infinity for a negative number.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The text string in In does not express a number.
- The text string in In does not end in a NULL character.
- The text string in In has a decimal point but not a fractional part.

## TO＿＊＊（Integer Conversion Group）

These instructions convert integers，bit strings，real numbers，and text strings to integers．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TO＿＊＊ | Integer Conversion Group | FUN | ＂＊＊＂must be an integer data type． | Out:=TO_** (In); <br> must be an integer data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | ${ }^{* 1}$ | --- | ${ }^{* 2}$ |
| Out | Conver－ <br> sion result | Output | Conversion result | ${ }^{* 1}$ | --- | --- |

＊1 The valid ranges depend on the data types of In and Out．
＊2 If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  |  | Bit s | rings |  |  |  |  | Inte | gers |  |  |  |  |  |  |  | dur | ion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 圌 } \end{aligned}$ | $\sum_{0}^{0}$ | 0 $\sum_{0}^{0}$ D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\underset{-1}{C}}{\substack{C}}$ | $\frac{\text { 득ㄱㄱㄴ }}{}$ | $\underset{\underset{1}{\mathrm{C}}}{\stackrel{\rightharpoonup}{5}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\underset{1}{\underline{1}}$ |  | $\bar{K}_{-1}^{\Gamma}$ | $$ | $\begin{aligned} & \text { 「 } \\ & \text { 䍗 } \end{aligned}$ | $\underset{\text { 근 }}{\overline{3}}$ | 号 | 긍 | 먹 | 翟 |
| In |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  | OK |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |

## Function

These instructions convert the integer，bit string，real number，or text string in In to an integer．
The name of the instruction is determined by the data type of conversion result Out．For example，if Out is the LINT data type，the instruction is TO＿LINT．
The following example for the TO＿LINT instruction is for when In is LREAL\＃1．0e＋10．

- Conversion is performed to within the effective digits of the data type of $I n$. If $I n$ is a real number, the fractional part is rounded off to the closest integer. The following table shows how values are rounded.

| Value of <br> fractional <br> part | Treatment | Examples |
| :--- | :--- | :--- |
| Less than <br> 0.5 | The fractional part is truncated. | $1.49 \rightarrow 1$ |
| 0.5 | If the ones digit is an even number, the fractional part <br> is truncated. If it is an odd number, the value is <br> rounded up. | $1.50 \rightarrow 2$ <br> $2.50 \rightarrow 2$ |
| Greater <br> than 0.5 | The fractional part is rounded up. | $1.51 \rightarrow 2$ |

The valid ranges for In and Out depend on their data types. Refer to the descriptions of the functions of the following instructions for the valid ranges: **_TO_*** (Integer-to-Integer Conversion Group) (page 2232), **_TO_*** (Bit String-to-Integer Conversion Group) (page 2-239), and **_TO_*** (Real Number-to-Integer Conversion Group) (page 2-246).
For detailed specifications when In is STRING data, refer to Function for the STRING_TO_** (Text String-to-Integer Conversion Group) instructions (page 2-270).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of Out.
- If the data type of $I n$ is for a bit string and the sizes of the data types of $I n$ and Out are different, the following processing is performed.
- If the data size of Out is larger than the data size of $I n$, the upper digits of Out will contain 0 .
- If the data size of Out is smaller than the data size of In, the upper digits are truncated in Out.
- Observe the following precautions if $I n$ is STRING data.
- If the first character in $I n$ is a minus sign (-) or a plus sign (+), it is processed as the sign.
- Except for a minus sign (-) or a plus sign (+) at the beginning, In must consist of consecutive ' 0 ' to ' 9 ' characters. Underbars (' $\quad$ ') and blank characters before or after the '-' or '+' are allowed in the text string.
- If the conversion result exceeds the valid range of Out, Out will contain an illegal value.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In is STRING data, but the text sting in In does not express a number.
- In is STRING data, but it does not end in a NULL character.

## TO_** (Bit String Conversion Group)

These instructions convert integers, bit strings, real numbers, and text strings to bit strings.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TO_** | Bit String Conversion Group | FUN | "***" must be a bit string data type. | Out:=TO_**(In); <br> must be a bit string data type. |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | ${ }^{* 1}$ | --- | ${ }^{* 2}$ |
| Out | Conver- <br> sion result | Output | Conversion result | ${ }^{* 1}$ | --- | --- |

*1 The valid ranges depend on the data types of In and Out.
*2 If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

These instructions convert the integer, bit string, real number, or text string in In to a bit string.
The name of the instruction is determined by the data type of conversion result Out. For example, if Out is the WORD data type, the instruction is TO_WORD.
The following example for the TO_WORD instruction is for when In is INT\#-1234.

The valid ranges for In and Out depend on their data types. Refer to the descriptions of the functions of the following instructions for the valid ranges: **_TO_*** (Integer-to-Bit String Conversion Group) (page 2-235), **_TO_*** (Bit String-to-Bit String Conversion Group) (page 2-242), and **_TO_** (Real Num-ber-to-Bit String Conversion Group) (page 2-249).
For detailed specifications when In is STRING data, refer to Function for the STRING_TO_** (Text String-to-Bit String Conversion Group) instructions (page 2-272).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of Out.
- If the conversion result exceeds the valid range of Out, Out will contain an illegal value.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In is STRING data, but the text sting in In does not express a number.
- In is STRING data, but it does not end in a NULL character.

## TO_** (Real Number Conversion Group)

These instructions convert integers, bit strings, real numbers, and text strings to real numbers.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TO_** | Real Number Conversion Group | FUN | "**" must be a real number data type. | Out:=TO_**(In); <br> "**" must be a real number data type. |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | ${ }^{* 1, * 2}$ | --- | $* 3$ |
| Out | Conver- <br> sion result | Output | Conversion result | ${ }^{* 1}$ | --- | --- |

*1 The valid ranges depend on the data types of In and Out.
*2 For STRING data, the valid range is 311 bytes max. ( 310 single-byte alphanumeric characters plus the final NULL character).
*3 If you omit the input parameter, the default value is not applied. A building error will occur.

|  | $$ |  | Bit s | rings |  |  |  |  | Inte | ers |  |  |  |  |  |  |  | dur |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O <br> O <br> O | $\underset{\substack{\text { D } \\ \text { N }}}{ }$ | $\begin{aligned} & \sum_{0} \\ & \text { D } \end{aligned}$ | 믕 임 O | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{\substack{-1}}{\substack{C}}$ | $\underset{\substack{\text { 든 }}}{ }$ | $\frac{\underset{i}{c}}{\bar{Z}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{\Sigma}_{1}$ | $\underset{\sim}{2}$ | ${\overline{\underset{\lambda}{2}}}^{\frac{1}{2}}$ | $\begin{aligned} & \text { D } \\ & \text { N } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \text { m } \\ & \end{aligned}$ | $\begin{aligned} & \frac{-1}{3} \\ & \frac{3}{n} \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \underset{1}{n} \end{aligned}$ | -7 | 먹 | O D 2 |
| In |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  | OK |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |

## Function

These instructions convert the integer, bit string, real number, or text string in In to a real number.
The name of the instruction is determined by the data type of conversion result Out. For example, if Out is the REAL data type, the instruction is TO_REAL. If the value of $I n$ is positive or negative infinity, the value of Out is positive or negative infinity.
The following example for the TO_REAL instruction is for when In is INT\#1234.

LD

```
ST
                                    abc:=TO_REAL(INT#1234);
```

In
INT data
INT\#1234 $\quad$ Out=abc $\quad 1.234 \mathrm{e}+3$

The valid ranges for In and Out depend on their data types. Refer to the descriptions of the functions of the following instructions for the valid ranges: **_TO_*** (Integer-to-Real Number Conversion Group) (page 2-237), **_TO_*** (Bit String-to-Real Number Conversion Group) (page 2-244), and **_TO_*** (Real Number-to-Real Number Conversion Group) (page 2-251).
For detailed specifications when In is STRING data, refer to Function for the STRING_TO_** (Text String-to-Real Number Conversion Group) instructions (page 2-274).

## Precautions for Correct Use

- Always use the correct instruction name for the data type of Out.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In is STRING data, but the text sting in In does not express a number.
- In is STRING data, but it does not end in a NULL character.

## TRUNC, Round, and RoundUp

These instructions change real numbers to integers.
TRUNC: Truncates the number at the first decimal digit.
Round: Rounds the number at the first decimal digit.
RoundUp: Rounds up the number at the first decimal digit.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TRUNC | Truncate | FUN |  | Out:=TRUNC(In); |
| Round | Round Off Real Number | FUN |  | Out:=Round(In); |
| RoundUp | Round Up Real Number | FUN |  | Out:=RoundUp(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | Depends on data type. | --- | $*$ |
| Out | Conver- <br> sion result | Output | Conversion result | Depends on data type. | --- | --- |

* If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

These instructions change the real number in In to an integer by eliminating the fractional part.

- TRUNC

The TRUNC instruction truncates the number at the first decimal digit.

## - Round

The Round instruction rounds the number at the first decimal digit. The following table shows how values are rounded.

| Value of <br> fractional part | Treatment | Examples |
| :--- | :--- | :--- |
| Less than 0.5 | The fractional part is truncated. | $1.49 \rightarrow 1$ |
|  |  | $-1.49 \rightarrow-1$ |
| 0.5 | If the ones digit is an even number, the fractional part <br>  <br> is truncated. If it is an odd number, the value is | $1.50 \rightarrow 2$ |
|  | rounded up. | $-50 \rightarrow 2$ |
|  |  | $-1.50 \rightarrow-2$ |
|  | $-2.50 \rightarrow-2$ |  |
| Greater than 0.5 | The fractional part is rounded up. | $1.51 \rightarrow 2$ |
|  |  | $-1.51 \rightarrow-2$ |

## - RoundUp

The RoundUp instruction rounds up the number at the first decimal digit.
The differences in these three instructions are shown by the following examples.

| Input value | Output value |  |  |
| :--- | :--- | :--- | :--- |
|  | TRUNC | Round | RoundUp |
| REAL\#1.6 | DINT\#1 | DINT\#2 | DINT\#2 |
| REAL\#1.5 | DINT\#1 | DINT\#2 | DINT\#2 |
| REAL\#1.5 | DINT\#1 | DINT\#1 | DINT\#2 |
| REAL\#2.5 | DINT\#2 | DINT\#2 | DINT\#3 |
| REAL\#-1.6 | DINT\#-1 | DINT\#-2 | DINT\#-2 |
| REAL\#-1.5 | DINT\#-1 | DINT\#-2 | DINT\#-2 |
| REAL\#-1.4 | DINT\#-1 | DINT\#-1 | DINT\#-2 |
| REAL\#-2.5 | DINT\#-2 | DINT\#-2 | DINT\#-3 |

The following example for the TRUNC instruction is for when In is REAL\#-3.55. The value of variable abc will be DINT\#-3.

LD

ST
abc:=TRUNC(REAL\#-3.55);

## Additional Information

If the data type of $I n$ is REAL, the data type of Out is DINT. If the data type of $I n$ is LREAL, the data type of Out is LINT.

## Precautions for Correct Use

If the conversion result exceeds the valid range of Out, Out will contain an illegal value.

## Bit String Processing Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| AND (\&), OR, and XOR | Logical AND/Logical OR/ <br> Logical Exclusive OR | $2-286$ |
| XORN | Logical Exclusive NOR | $2-289$ |
| NOT | Bit Reversal | $2-291$ |
| AryAnd, AryOr, AryXor, and | Array Logical AND/ <br> AryXorN | Array Logical OR/ <br> Array Logical Exclusive OR/ |

## AND（\＆），OR，and XOR

These instructions perform processing on Boolean variables or individual bits in bit stings．
AND（\＆）：Logical AND
OR：Logical OR
XOR：Logical Exclusive OR

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AND（\＆） | Logical AND | FUN |  | Out：＝In1 AND ．．AND InN； Out：＝ln1 \＆．．\＆InN； |
| OR | Logical OR | FUN |  | Out：＝In1 OR ． $\mathrm{OR} \operatorname{lnN}$ ； |
| XOR | Logical Exclusive OR | FUN |  | Out：＝In1 XOR ．$\times$ XOR InN； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to InN | Data to <br> process | Input | Data to process，where N is <br> 2 to 5 | Depends on data type． | --- | $0^{\star}$ |
| Out | Processing <br> result | Output | Processing result | Depends on data type． | --- | --- |

＊If you omit the input parameter that connects to $\operatorname{In} N$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\operatorname{In} 1$ and $\operatorname{In} 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

\end{tabular}

## Function

These instructions perform processing on Boolean variables or corresponding bits in bit strings. The data to process is in $\operatorname{In} 1$ to $\operatorname{InN}$. $\operatorname{In} 1$ to $\operatorname{In} N$ and Out must be the same data types.
If there are more than two data to process, processing is performed with the following procedure.
1
Processing is performed for $\operatorname{In} 1$ and $\operatorname{In} 2$.
2 Processing is performed for the results of step 1 and $\operatorname{In} 3$.
3 Processing is performed for the results of step 2 and $\operatorname{In} 4$.
$\vdots \quad \vdots$

- AND (\&)

If both bits are TRUE, then the processing result is TRUE. Otherwise, the processing result is FALSE.

| In1 bit | In2 bit | Out bit |
| :--- | :--- | :--- |
| FALSE | FALSE | FALSE |
| FALSE | TRUE | FALSE |
| TRUE | FALSE | FALSE |
| TRUE | TRUE | TRUE |

## - OR

If both bits are FALSE, then the processing result is FALSE. Otherwise, the processing result is TRUE.

| In1 bit | In2 bit | Out bit |
| :--- | :--- | :--- |
| FALSE | FALSE | FALSE |
| FALSE | TRUE | TRUE |
| TRUE | FALSE | TRUE |
| TRUE | TRUE | TRUE |

## - XOR

If both bits are the same, then the processing result is FALSE. If one bit is TRUE and the other is FALSE, then the processing result is TRUE.

| In1 bit | In2 bit | Out bit |
| :--- | :--- | :--- |
| FALSE | FALSE | FALSE |
| FALSE | TRUE | TRUE |
| TRUE | FALSE | TRUE |
| TRUE | TRUE | FALSE |

The following example shows the AND instruction when $\operatorname{In} 1$ is BYTE\#16\#3A, In2 is BYTE\#16\#28 and In3 is BYTE\#16\#73.

The functions of the AND instruction and the \& instruction are exactly the same. Use the form that is easier to use.

## Additional Information

In ST, there is no limit to the number of input variables if you use the following notation.
Out:=In1 AND In2 AND $\ln 3$ AND $\ln 4$ AND $\ln 5$ AND $\operatorname{In} 6 \ldots$
Out:=|n1 \& $\ln 2 \& \ln 3 \& \ln 4 \& \ln 5 \& \ln 6 \ldots$
Out:=In1 OR $\operatorname{In} 2 O R \operatorname{In} 3 O R \operatorname{In} 4 O R \operatorname{In} 5 O R \operatorname{In} 6 \ldots$
Out:=In1 XOR $\ln 2 X O R \operatorname{In} 3 X O R \ln 4 X O R \operatorname{In} 5 X O R \operatorname{In} 6 \ldots$

## Precautions for Correct Use

The data types of $\operatorname{In} 1$ to $\operatorname{In} N$ and Out must all be the same. Otherwise, a building error will occur.

## XORN

The XORN instruction performs a logical exclusive NOR operation on Boolean variables or individual bits in bit stings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| XORN | Logical Exclusive NOR | FUN |  | Out：＝In1 XOR NOT ．．XOR NOT InN； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to InN | Data to <br> process | Input | Data to process，where N is <br> 2 to 5 | Depends on data type． | --- | $0^{*}$ |
| Out | Processing <br> result | Output | Processing result | Depends on data type． | --- | －－－ |

＊If you omit the input parameter that connects to $I n N$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\operatorname{In} 1$ and $\ln 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 䍜 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 圌 } \end{aligned}$ | $\begin{aligned} & \sum_{0} \\ & \text { D } \end{aligned}$ | 믕 O D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\substack{C}}{\substack{c}}$ | $\stackrel{\text { 들 }}{\substack{1}}$ | $\frac{\text { C }}{\overline{2}}$ | $\sum_{-1}^{\infty}$ | $\sum_{1}$ | $\underset{\sim}{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 罠 } \\ & \hline \end{aligned}$ | $\begin{gathered} \frac{-1}{1} \\ \frac{1}{n} \end{gathered}$ | 号 | 금 | 억 | ¢ |
| In1 to InN | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  | ust b | sam | dat | type | as In | to |  |  |  |  |  |  |  |

## Function

The XORN instruction performs processing on Boolean variables or corresponding bits in bit strings． The data to process is in $\operatorname{In} 1$ to $\operatorname{InN}$ ． $\operatorname{In} 1$ to $\operatorname{In} N$ and Out must be the same data types．

If there are more than two data to process，processing is performed with the following procedure．
Processing is performed for $\operatorname{In} 1$ and $\operatorname{In} 2$ ．
2 Processing is performed for the results of step 1 and $\operatorname{In} 3$ ．
3
Processing is performed for the results of step 2 and $\operatorname{In} 4$ ．

```
    \vdots \vdots
```

The relationships between input and output variables are given in the following table. If both values are the same, then the processing result is TRUE. Otherwise, the processing result is FALSE.

| In1 bit | In2 bit | Out bit |
| :--- | :--- | :--- |
| FALSE | FALSE | TRUE |
| FALSE | TRUE | FALSE |
| TRUE | FALSE | FALSE |
| TRUE | TRUE | TRUE |

The following example is for when $\operatorname{In} 1$ is BYTE\#16\#3A, In2 is BYTE\#16\#28, and $\operatorname{In} 3$ is BYTE\#16\#73.

LD

In2=BYTE\#16\#28 0|0|10|1|0|0|0
In3=BYTE\#16\#73 0|1|11|0|0|11

Logical exclusive NORs between bits
Out=abc 01110000011

ST
abc:=BYTE\#16\#3A XOR NOT BYTE\#16\#28 XOR NOT BYTE\#16\#73;

## Precautions for Correct Use

The data types of $\operatorname{In} 1$ to $\operatorname{InN}$ and Out must all be the same. Otherwise, a building error will occur.

## NOT

The NOT instruction reverses the value of a Boolean variable or the individual bits in a bit string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| NOT | Bit Reversal | FUN |  | Out：＝NOT（In）； |

Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> process | Input | Data to process | Depends on data type． | --- | ＊ |
| Out | Processing <br> result | Output | Processing result | Depends on data type． | --- | --- |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { O} \\ & \stackrel{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ |  | Bit st | rings |  |  |  |  | Inte | ers |  |  |  |  |  |  | mes | $\begin{aligned} & \text { dur } \\ & \text { d te } \end{aligned}$ | str |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { DO } \\ & \hline \mathrm{O} \end{aligned}$ | $\underset{\sim}{\text { ロ⿴囗㐅 }}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 0 $\sum_{0}^{0}$ D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{\text { 들 }}{2}$ | $\underset{\underset{1}{C}}{\stackrel{C}{c}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\bar{z}_{1}$ | ${\underset{Z}{2}}_{2}^{2}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \text { I } \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | 号 | 금 | 먹 | 足 |
| In | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | Must be same data type as In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The NOT instruction reverses the value of a Boolean variable or the values of individual bits in a bit string．The data to process is in In．In and processing result Out must have the same number of bits， i．e．，they must be the same data type．
The following example is for when $I n$ is BYTE\＃16\＃73．

## Precautions for Correct Use

The data types of In and Out must be the same. Otherwise, a building error will occur.

## AryAnd, AryOr, AryXor, and AryXorN

These instructions process Boolean variables or individual bits in bit stings between arrays.
AryAnd: Logical AND
AryOr: Logical OR
AryXor: Logical Exclusive OR
AryXorN: Logical Exclusive NOR

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryAnd | Array Logical AND | FUN |  | AryAnd(In1, In2, Size, AryOut); |
| AryOr | Array Logical OR | FUN |  | $\begin{aligned} & \text { AryOr(In1, In2, Size, Ary- } \\ & \text { Out); } \end{aligned}$ |
| AryXor | Array Logical Exclusive OR | FUN |  | AryXor(In1, In2, Size, AryOut); |
| AryXorN | Array Logical Exclusive NOR | FUN |  | AryXorN(In1, In2, Size, AryOut); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1[] and In2[] (arrays) | Array to process | Input | Array to process | Depends on data type. | --- | * |
| Size | Number of elements |  | Number of elements to process |  |  | 1 |
| AryOut[] (array) | Processing results array | In-out | Processing results array | Depends on data type. | --- | --- |
| Out | Return value | Output | Always TRUE | TRUE only | --- | --- |

* If you omit an input parameter, the default value is not applied. A building error will occur.

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 䍙 } \\ & \hline \end{aligned}$ |  | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { OD } \end{aligned}$ | ${\underset{\sim}{\mathcal{O}}}_{\substack{C}}$ | $\underset{\underset{1}{C}}{\substack{C}}$ | $\frac{\text { 들 }}{\frac{1}{z}}$ | $\frac{\underset{1}{\mathrm{C}}}{\underset{1}{2}}$ | $\sum_{\underset{1}{\infty}}^{\infty}$ | $\sum_{1}$ | $\underset{\text { 믁 }}{ }$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { D } \\ & \text { 苋 } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \text { I } \end{aligned}$ | $\begin{aligned} & \text { 깇 } \\ & \frac{1}{n} \end{aligned}$ | 号 | 금 | 먹 | 第 |
| $\ln 1[]$（array） | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| In2［］（array） | Must be same data type as In1［］ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be same data type as In1［］ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions process Size elements from the beginning of arrays to process In1［］and In2［］．Pro－ cessing is performed for corresponding bits of corresponding elements．The processing results are stored in corresponding elements of AryOut［］．In1［］to In2［］and AryOut［］must be the same data types．
The relationships between input and output variables are given in the following tables．

## －AryAnd

If both bits are TRUE，then the processing result is TRUE．Otherwise，the processing result is FALSE．

| Bit of ele－ <br> ment in $\boldsymbol{n} 1[]]$ | Bit of ele－ <br> ment in In2［］ | Bit of Ary－ <br> Out [] |
| :--- | :--- | :--- |
| FALSE | FALSE | FALSE |
| FALSE | TRUE | FALSE |
| TRUE | FALSE | FALSE |
| TRUE | TRUE | TRUE |

－AryOr
If both bits are FALSE，then the processing result is FALSE．Otherwise，the processing result is TRUE．

| Bit of ele－ <br> ment in $\boldsymbol{n} 1[]$ | Bit of ele－ <br> ment in $\boldsymbol{I n} 2[]$ | Bit of Ary－ <br> Out［］ |
| :--- | :--- | :--- |
| FALSE | FALSE | FALSE |
| FALSE | TRUE | TRUE |
| TRUE | FALSE | TRUE |
| TRUE | TRUE | TRUE |

## - AryXor

If both bits are the same, then the processing result is FALSE. If one bit is TRUE and the other is FALSE, then the processing result is TRUE.

| Bit of ele- <br> ment in In1[] | Bit of ele- <br> ment in $\boldsymbol{\text { nn2[] }}$ [ | Bit of Ary- <br> Out[] |
| :--- | :--- | :--- |
| FALSE | FALSE | FALSE |
| FALSE | TRUE | TRUE |
| TRUE | FALSE | TRUE |
| TRUE | TRUE | FALSE |

## - AryXorN

If both bits are the same, then the processing result is TRUE. If one bit is TRUE and the other is FALSE, then the processing result is FALSE.

| Bit of ele- <br> ment in In1[] | Bit of ele- <br> ment in In2[] | Bit of Ary- <br> Out[] |
| :--- | :--- | :--- |
| FALSE | FALSE | TRUE |
| FALSE | TRUE | FALSE |
| TRUE | FALSE | FALSE |
| TRUE | TRUE | TRUE |

The following example shows the AryAnd instruction when Size is UINT\#3.

LD

ST

AryAnd(abc[1], def[2], UINT\#3, ghi[3]);

| AND | In2[0]=def[2] | RUE | AryOut 0$]=$ ghi[ 3$]$ | TRUE |
| :---: | :---: | :---: | :---: | :---: |
| D | $\mathrm{ln} 2[1]=\operatorname{def}[3]$ | RU | $\rightarrow$ AryOut[1]=ghi[4] | FALSE |
| AND | $\mathrm{ln} 2[2]=\mathrm{def}[4]$ | FALSE | AryOut[2]=ghi[5] | FALSE |

## Precautions for Correct Use

- The data types of In1[], In2[], and AryOut[] must be the same.
- Use an AryOut[] array that has at least as many elements as the value of Size.
- The values in AryOut[] do not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- In1[], In2[], and AryOut[] have different data types.
- The value of Size exceeds the number of elements in In1[], In2[], or AryOut[].

2 Instruction Descriptions

## Selection Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| SEL | Binary Selection | $2-298$ |
| MUX | Multiplexer | $2-300$ |
| LIMIT | Limiter | $2-302$ |
| Band | Deadband Control | $2-304$ |
| Zone | Dead Zone Control | $2-307$ |
| MAX and MIN | Maximum/Minimum | $2-310$ |
| AryMax and AryMin | Array Maximum/Array Minimum | $2-312$ |
| ArySearch | Array Search | $2-314$ |

## SEL

The SEL instruction selects one of two selections.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SEL | Binary Selection | FUN |  | Out:=SEL(G, $\ln 0, \ln 1)$; |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| G | Gate | Input | FALSE: Selects InO. <br> TRUE: Selects In1. | Depends on data type. | --- | FALSE |
| In0 and In1 | Selections |  | Selections |  |  | * |
| Out | Selection result | Output | Selection result | Depends on data type. | --- | --- |

* If you omit the input parameter, the default value is not applied. A building error will occur.

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times, durations, dates, and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ |  | $\begin{aligned} & \text { K } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z 1}{C}}_{\substack{C}}$ | $\underset{\substack{C}}{C}$ | $\sum_{-1}^{C}$ | $\frac{\mathrm{C}}{\underset{1}{2}}$ | $\underset{Z}{\infty}$ | $\bar{z}_{1}$ | ${\underset{N}{2}}_{0}^{0}$ | $\sum_{-1}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \text { 只 } \end{aligned}$ | $\frac{-1}{3}$ | $\begin{aligned} & \text { 8 } \\ & \text { n } \\ & \hline \end{aligned}$ | -7 | 먹 |  |
| G | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| In0 and In1 | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| Out | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |

## Function

The SEL instruction selects one of two selections, $\operatorname{In} 0$ and $\operatorname{In} 1$. Gate $G$ specifies which of $\operatorname{In} 0$ and $\operatorname{In} 1$ to select. If $G$ is FALSE, In0 is assigned to Out. If $G$ is TRUE, In1 is assigned to Out.

The following example is for when $\operatorname{InO}$ is $\operatorname{INT} \# 10, \operatorname{In1}$ is $\operatorname{INT} \# 20$, and $G$ is TRUE. The value of variable $a b c$ will be INT\#20.

LD

ST
abc:=SEL(TRUE, INT\#10, INT\#20);

## Additional Information

Use the MUX instruction (page 2-300) to select one of two or more selections.

## Precautions for Correct Use

- In0, In1, and Out may be different data types, but observe the following precautions.
- Set the valid range of Out to include the valid ranges of In0 and In1.
- InO, In1, and Out cannot be different varieties of data types (such as a bit string and an integer, or an integer and a text string).
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In0 or $\operatorname{In} 1$ is STRING data and the number of bytes in the selection result exceeds the size of the output parameter that is connected to Out.
- In0 or $\operatorname{In} 1$ is STRING data and it does not end in a NULL character.

## MUX

The MUX instruction selects one of three to five selections．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MUX | Multiplexer | FUN |  | $\begin{aligned} & \text { Out:=MUX(K, } \operatorname{In} 0, \ln 1, \cdots, \\ & \operatorname{lnN}) ; \end{aligned}$ |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| K | Selector | Input | 0 ：Selects $\operatorname{In} 0$ ． <br> 1：Selects In1． <br> 2：Selects In2． <br> 3：Selects In3． <br> 4：Selects In4． | 0 to N | －－－ | ＊1 |
| In 0 to InN | Selections |  | Selections N is 2 to 4 ． | Depends on data type． |  | 0＊2 |
| Out | Selection result | Output | Selection result | Depends on data type． | －－－ | －－－ |

＊1 If you omit an input parameter，the default value is not applied．A building error will occur．
＊2 If you omit the input parameter that connects to $I n N$ ，the default value is not applied，and a building error will occur．For example，if N is 2 and the input parameters that connect to $\operatorname{InO}$ and $\operatorname{In1}$ are omitted，the default values are applied，but if the input parameter that connects to In2 is omitted，a building error will occur．

|  | $\begin{aligned} & \text { o } \\ & \text { o } \\ & \text { 응 } \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  | $\begin{aligned} & \text { J } \\ & \frac{3}{3} \\ & \stackrel{\rightharpoonup}{0} \\ & \stackrel{0}{\omega} \\ & \hline \end{aligned}$ |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 잉 ㅇ ㅇ |  | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{array}{\|l} \hline 0 \\ \sum_{0}^{0} \\ \text { D } \\ \hline \end{array}$ |  | $\underset{\underset{-1}{C}}{\substack{C}}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ |  | $\underset{\underset{1}{\overline{1}}}{\stackrel{\rightharpoonup}{5}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\text { 믁 }}$ | $\bar{Z}_{\underset{1}{2}}$ | $\begin{aligned} & \text { D } \\ & \text { I } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 罗 } \end{aligned}$ | $\frac{-1}{\overline{3}}$ | $\begin{aligned} & \text { 몰 } \\ & \text { n } \end{aligned}$ | 금 | 먹 | 第 |
| K |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| In0 to InN | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| Out | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |

## Function

The MUX instruction selects one of three to five selections， $\operatorname{InO}$ to $\operatorname{InN}$ ．
Selector $K$ specifies which of $\operatorname{InO}$ to $\operatorname{InN}$ to select．

The value of one of the input variables is assigned to Out according to the value of $K$. InO is assigned if $K$ is $0, \ln 1$ is assigned if $K$ is 1 , etc.

The following example is for when $\operatorname{In} 0$ is INT\#10, In1 is INT\#20, In2 is INT\#30, and $K$ is USINT\#2. The value of variable $a b c$ will be INT\#30.

## Additional Information

Use the SEL instruction (page 2-298) to select one of two selections.

## Precautions for Correct Use

- InO to $\operatorname{InN}$ and Out may be different data types, but observe the following precautions.
- Set the valid range of Out to include the valid ranges of $\operatorname{InO}$ to $\operatorname{InN}$.
- InO to InN and Out cannot be different varieties of data types (such as a bit string and an integer, or an integer and a text string).
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of $K$ is outside the valid range (i.e., less than 0 or greater than N ).
- A variable between InO and InN is STRING data and the number of bytes in the selection result exceeds the size of the output parameter that is connected to Out.
- One of the variables between $\operatorname{InO}$ and $\operatorname{InN}$ is STRING data and it does not end in a NULL character.

## LIMIT

The LIMIT instruction limits the value of the input variable to the specified minimum and maximum val－ ues．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| LIMIT | Limiter | FUN |  | Out：＝LIMIT（MN，In，MX）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MN | Minimum value | Input | Minimum value of limiter | Depends on data type． | －－－ | ＊ |
| In | Data to limit |  | Data to limit |  |  |  |
| MX | Maximum value |  | Maximum value of limiter |  |  |  |
| Out | Processing result | Output | Processing result | Depends on data type． | －－－ | －－－ |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { © } \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 䍙 } \end{aligned}$ | $\begin{aligned} & \text { 䙵 } \end{aligned}$ | $\begin{aligned} & \sum_{0} \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { O} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\substack{C}}{\substack{C}}$ | $\frac{\text { 들 }}{}$ | $\underset{\underset{1}{\mathrm{E}}}{\stackrel{C}{n}}$ | $\sum_{-1}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\sim}{\mathrm{Z}}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \end{aligned}$ | $\begin{aligned} & \frac{-1}{1} \\ & \frac{1}{n} \end{aligned}$ | $\begin{aligned} & \text { 右 } \\ & \cdots \end{aligned}$ | 금 | 믹 |  |
| MN |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| MX |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The LIMIT instruction limits the value of data to limit In according to the maximum value, $M X$, and the minimum value, $M N$. The value of processing result Out is as shown below.

| Value of $\boldsymbol{I n}$ | Value of Out |
| :--- | :--- |
| $\mathrm{In}<\mathrm{MN}$ | MN |
| $\mathrm{MN} \leq \ln \leq \mathrm{MX}$ | In |
| $\mathrm{MX}<\ln$ | MX |

The following example is for when $M N$ is INT\#-10 and $M X$ is INT\#20.

## Precautions for Correct Use

- In, $M N, M X$, and Out may be different data types, but observe the following precautions.
- Set the valid range of Out to include the valid ranges of $I n, M N$, and $M X$.
- Do not combine signed integers (SINT, INT, DINT, and LINT) together with unsigned integers (USINT, UINT, UDINT, and ULINT) for In, MN, and MX.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The value of $M X$ is smaller than the value of $M N$.

## Band

The Band instruction performs deadband control．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Band | Deadband Control | FUN |  | Out：＝Band（MN，In，MX）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MN | Minimum value | Input | Minimum value of deadband | Depends on data type． | －－－ | ＊ |
| In | Data to control |  | Data to control |  |  |  |
| MX | Maximum value |  | Maximum value of deadband |  |  |  |
| Out | Processing result | Output | Processing result | Depends on data type． | －－－ | －－－ |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  |  |  | s | ings |  |  |  |  | Inte | ers |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \text { s, a } \end{aligned}$ | $\begin{aligned} & \text { dur: } \\ & \text { d tex } \end{aligned}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 置 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 眇 } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{\sim}{1}}_{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\stackrel{\text { 들 }}{\underset{1}{2}}$ | $\frac{\underset{i}{C}}{\stackrel{C}{2}}$ | $\underset{Z}{\infty}$ | $\bar{\Sigma}_{1}$ | 은 | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { in } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 荡 } \end{aligned}$ | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 음 | 막 |  |
| MN |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| MX |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The Band instruction controls the value of data to control In according to the maximum value, $M X$, and the minimum value, $M N$. The value of processing result Out is as shown below.

| Value of $\boldsymbol{I n}$ | Value of Out |
| :--- | :--- |
| $\mathrm{In}<\mathrm{MN}$ | $\mathrm{In}-\mathrm{MN}$ |
| $\mathrm{MN} \leq \ln \leq \mathrm{MX}$ | 0 |
| $\mathrm{MX}<\ln$ | $\operatorname{In}-\mathrm{MX}$ |

The following example is for when $M N$ is INT\#-10 and $M X$ is INT\#20.
LD
ST

def:=Band(INT\#-10, abc, INT\#20);

## Precautions for Correct Use

- In, MN, MX, and Out may be different data types, but observe the following precaution.
- Set the valid range of Out to include the valid ranges of $I n, M N$, and $M X$.
- If the value of $I n$ is nonnumeric data, the value of Out is nonnumeric data.
- If the value of $I n, M N$, or $M X$ is positive infinity or negative infinity, the value of Out is as shown below.

| Value of $\boldsymbol{I n}$ | Value of $\boldsymbol{M N}$ | Value of $\boldsymbol{M X}$ | Value of Out |
| :--- | :--- | :--- | :--- |
| $+\infty$ | $+\infty$ | $+\infty$ | 0 |
|  |  | $-\infty$ | Error |
|  |  | $+\infty$ | $+\infty$ |
|  |  | $-\infty$ | $+\infty$ |

| Value of $\boldsymbol{I n}$ | Value of $\boldsymbol{M N}$ | Value of $\boldsymbol{M} \boldsymbol{X}$ | Value of Out |
| :--- | :--- | :--- | :--- |
| $-\infty$ | $+\infty$ | $+\infty$ | $-\infty$ |
|  |  | Error |  |
|  | $-\infty$ | $+\infty$ | 0 |
|  |  | $-\infty$ | 0 |

- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of $M X$ is smaller than the value of $M N$.
- Either MX or MN contains nonnumeric data.
- The processing result exceeds the valid range of Out.

## Zone

The Zone instruction adds a bias value to the input value．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Zone | Dead Zone Control | FUN |  | Out：＝Zone（BiasN，In， BiasP）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| BiasN | Negative bias | Input | Negative bias | Depends on data type． | －－－ | ＊ |
| In | Data to control |  | Data to control |  |  |  |
| BiasP | Positive bias |  | Positive bias |  |  |  |
| Out | Processing result | Output | Processing result | Depends on data type． | －－－ | －－－ |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  | $$ |  | it s | ings |  |  |  |  | Inte | gers |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \text { s, } \end{aligned}$ | $\begin{aligned} & \text { dure } \\ & \text { d tex } \end{aligned}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 置 } \\ & \text { } \end{aligned}$ | $\begin{aligned} & \text { 䍐 } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 00 \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\sum_{\underset{1}{6}}^{\substack{C}}$ | $\underset{\substack{C}}{C}$ | $\frac{\mathrm{C}}{\underset{Z}{\mathrm{E}}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\underset{\substack{\infty}}{\infty}$ | $\bar{\Sigma}_{1}$ | ${\underset{N}{2}}_{0}^{0}$ | $\overline{ }_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { 苋 } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{8} \end{aligned}$ | $\stackrel{-1}{\overline{1}}$ | $\begin{aligned} & \text { 另 } \\ & \text { 敫 } \end{aligned}$ | 웅 | 먹 |  |
| BiasN |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| In |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| BiasP |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The Zone instruction controls the value of data to control In according to the positive bias, BiasP, and the negative bias, BiasN. The value of processing result Out is as shown below.

| Value of $\ln$ | Value of <br> Out |
| :--- | :--- |
| $\ln <0$ | $\ln +$ BiasN |
| $\ln =0$ | 0 |
| $0<\ln$ | $\ln +\operatorname{BiasP}$ |

The following example is for when BiasP is INT\#20 and BiasN is INT\#-20.
LD

def:=Zone(INT\#-20, abc, INT\#20);

## Precautions for Correct Use

- In, BiasP, BiasN, and Out may be different data types, but observe the following precaution.
- Set the valid range of Out to include the valid ranges of In, BiasP, and BiasN.
- If the value of $I n$ is nonnumeric data, the value of Out is nonnumeric data.
- If the value of $I n, B i a s P$, or BiasN is positive infinity or negative infinity, the value of Out is as shown below.

| Value of $\boldsymbol{I n}$ | Value of BiasP | Value of BiasN | Value of Out |
| :--- | :--- | :--- | :--- |
| $+\infty$ |  | $+\infty$ | $+\infty$ |
|  |  | $-\infty$ | $+\infty$ |
|  |  | $+\infty$ | Error |
|  |  | $-\infty$ | 0 |

| Value of $\boldsymbol{I n}$ | Value of BiasP | Value of BiasN | Value of Out |
| :--- | :--- | :--- | :--- |
| $-\infty$ | $+\infty$ | $+\infty$ | 0 |
|  |  | $-\infty$ |  |
|  | $-\infty$ | $+\infty$ | Error |
|  |  | $-\infty$ | $-\infty$ |

- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- BiasP is less than BiasN.
- Either BiasP or BiasN contains nonnumeric data.
- The processing result exceeds the valid range of Out.

## MAX and MIN

MAX：Finds the largest of two to five values．
MIN：Finds the smallest of two to five values．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MAX | Maximum | FUN |  | Out：＝MAX（ $\ln 1, \ln 2, \cdots, \operatorname{lnN})$ ； |
| MIN | Minimum | FUN |  | Out $=\mathrm{MIN}(\ln 1, \ln 2, \cdots, \operatorname{lnN})$ ； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to InN | Data to <br> process | Input | Data to process，where N is <br> 2 to 5 | Depends on data type． | --- | $0^{*}$ |
| Out | Search <br> result | Output | Search result | Depends on data type． | --- | --- |

＊If you omit the input parameter that connects to $\operatorname{In} N$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\ln 1$ and $\operatorname{In} 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 䍙 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { D } \\ & \text { 구N } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 $\sum_{0}^{0}$ D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { 召 } \end{aligned}$ | $\frac{\underset{\sim}{C}}{\underset{Z}{C}}$ |  |  | $\underset{\underset{i}{C}}{\stackrel{C}{2}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 글 } \\ & \frac{1}{2} \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \text { In } \end{aligned}$ | 금 | 먹 | 号 |
| In1 to InN |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

## - MAX

The MAX instruction finds the largest value of two to five data to process, $\ln 1$ to $\ln N$.

- MIN

The MIN instruction finds the smallest value of two to five data to process, In1 to $\operatorname{InN}$.
The following example is for the MAX instruction when $\operatorname{In} 1$ is INT\#10, $\operatorname{In} 2$ is INT\#5, $\operatorname{In} 3$ is INT\#23, $\operatorname{In} 4$ is INT\#14, and In5 is INT\#-5.

## LD

In1
INT\#10
In2
INT\#5
In3 INT \#23 $\longrightarrow$ Out $=$ abc
In4
INT\#14
In5 INT\#-5

## Additional Information

To find the largest or smallest of six or more values, use the AryMax or AryMin instruction (page 2-312).

## Precautions for Correct Use

- In1 to InN and Out may be different data types, but observe the following precaution.
- Set the valid range of Out to include the valid ranges of $\operatorname{In} 1$ to $\operatorname{In} N$.
- Do not combine signed integers (SINT, INT, DINT, and LINT) together with unsigned integers (USINT, UINT, UDINT, and ULINT) for In1 to InN.
- If $\operatorname{In} 1$ to $\operatorname{InN}$ are real numbers, the desired results may not be achieved due to error.

## AryMax and AryMin

AryMax：Finds the elements with the largest value in a one－dimensional array．
AryMin：$\quad$ Finds the elements with the smallest value in a one－dimensional array．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryMax | Array Maximum | FUN |  | Out：＝AryMax（In，Size， InOutPos，Num）； |
| AryMin | Array Minimum | FUN |  | Out:=AryMin(In, Size, InOut- Pos，Num）； |

Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln []$（array） | Array to search | Input | Array to search | Depends on data type． | －－－ | ＊ |
| Size | Number of elements to search |  | Number of elements in $\operatorname{In}[]$ to search |  |  | 1 |
| InOutPos | Found element number | In－out | Array element number where value was found | Depends on data type． | －－－ | －－－ |
| Out | Search result | Output | Search result | Depends on data type． | －－－ | －－－ |
| Num | Number found |  | Number found |  |  |  |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { O } \\ & \text { O } \\ & \underline{0} \\ & \text { O/ } \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\Gamma$ $\sum$ 0 0 | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\substack{\mathrm{Z}}}{\substack{2}}$ | ${\underset{\sim}{2}}_{\substack{C}}$ | $\frac{\stackrel{c}{\underset{1}{2}}}{}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{N}{2}}_{\square}^{0}$ | $\bar{\Sigma}_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 罧 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \frac{-1}{3} \\ & \frac{1}{n} \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \end{aligned}$ | -1 | 먹 |  |
| In［］（array） |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOutPos |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Num |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions search Size elements in array to search $\operatorname{In}[]$ starting from $\operatorname{In}[0]$. The value that is found is assigned to Out, the element number where it was found is assigned to InOutPos, and the number of times the value was found is assigned to Num. If Num is greater than 1, the value in InOutPos is the number of the lowest element that contains the value that was found.

## - AryMax

The AryMax instruction finds the largest value.

## AryMin

The AryMin instruction finds the smallest value.

The following example shows the AryMax instruction when Size is UINT\#6.
The input parameter that is passed to $\operatorname{In}[]$ is $a b c[2]$, so the search starts from $a b c[2]$.
LD
ST
ghi:=AryMax(abc[2], UINT\#6, def, jkl);

The lowest element number that contains the largest value is 3 .

> Size=UINT\#6
> $\left\{\begin{array}{l}\ln [0]=a b c[2] \\ \ln [1]=a b c[3] \\ \ln [2]=a b c[4] \\ \ln [3]=a b c[5] \\ \ln [4]=a b c[6] \\ \ln [5]=a b c[7]\end{array}\right.$

## Precautions for Correct Use

- If you use a different data type for $\operatorname{In}[]$ and Out, make sure the valid range of Out includes the valid range of $\operatorname{In}[]$.
- If $\operatorname{In}[]$ contains real numbers, the desired results may not be achieved due to error.
- Always used a one-dimensional array for $\operatorname{In}[]$.
- If the value of Size is 0 , the values of Out and Num are 0 . The value of InOutPos does not change.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Size is outside of the valid range.
- Size exceeds the array area of $\operatorname{In}[]$.
- In[] is not a one-dimensional array.

## ArySearch

The ArySearch instruction searches for the specified value in a one－dimensional array．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ArySearch | Array Search | FUN |  | Out：＝ArySearch（In，Size， Key，InOutPos，Num）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln []$（array） | Array to search | Input | Array to search | Depends on data type． | －－－ | ＊ |
| Size | Number of elements to search |  | Number of elements in $\operatorname{In}[]$ to search | 1 to 65535 |  | 1 |
| Key | Search key |  | Value to search for | Depends on data type． |  | －－－ |
| InOutPos | Found element number | In－out | Array element number where value was found | Depends on data type． | －－－ | －－－ |
| Out | Search result | Output | Search result | Depends on data type． | －－－ | －－－ |
| Num | Number found |  | Number found |  |  |  |

＊If you omit an input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \text { ロ } \\ & \text { I } \end{aligned}$ | $\sum$ O D | 号 | 号 | ${\underset{Z}{\mathrm{~B}}}_{\substack{C}}$ | $\underset{-1}{C}$ | $\underset{\text { 즐 }}{\text { C }}$ | $\underset{\substack{\text { ¢ }}}{\text { ¢ }}$ | $\sum_{Z 1}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{2}$ | $\bar{z}_{-1}$ | $$ | $\xrightarrow{\text { T }}$ | －긏 | 号 | 금 | 먹 |  |
| $\ln []$（array） | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
|  | Arrays of enumerations can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Key | Must be same data type as the elements of In［］． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOutPos |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The ArySearch instruction searches Size elements of one-dimensional array to search $\operatorname{In}[]$ for elements with the same value as search key Key. The search starts from In[0].
The values of search result Out, found element number InOutPos, and number found Num are as follows:

| Element with <br> same value as <br> Key | Out | InOutPos | Num |
| :--- | :--- | :--- | :--- |
| Exists. | TRUE | Lowest element number that con- <br> tains the same value as Key | Number of elements with <br> same value as Key |
| Does not exist. | FALSE | Does not change. | 0 |

The following example is for when Size is UINT\#6 and Key is INT\#5555.
The input parameter that is passed to $\operatorname{In}[]$ is $a b c[2]$, so the search starts from $a b c[2]$.

LD

ST
ghi:=ArySearch(abc[2], UINT\#6, INT\#5555, def, jkl);

The lowest element number that

## Precautions for Correct Use

- Always use a one-dimensional array for $\operatorname{In}[]$.
- Make sure that Key has the same data type as the elements of $\operatorname{In}[]$.
- If the value of Size is 0 , the values of Out and Num are 0 . The value of InOutPos does not change.
- When Key is an enumeration, always use a variable for the input parameter to pass to Key. A building error will occur if a constant is passed.
- An error occurs in the following cases. ENO will be FALSE, and Out, Num, and InOutPos will not change.
- Size exceeds the array area of $\operatorname{In}[]$.
- In[] or Key is STRING data and it does not end in a NULL character.
- In[] is not a one-dimensional array.

2 Instruction Descriptions

## Data Movement Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| MOVE | Move | $2-318$ |
| MoveBit | Move Bit | $2-321$ |
| MoveDigit | Move Digit | $2-323$ |
| TransBits | Move Bits | $2-325$ |
| MemCopy | Memory Copy | $2-327$ |
| SetBlock | Block Set | $2-329$ |
| Exchange | Data Exchange | $2-331$ |
| AryExchange | Array Data Exchange | $2-333$ |
| AryMove | Array Move | $2-335$ |
| Clear | Bit Pattern Copy (Bit String to <br> Signed Integer) Group | $2-337$ |
| Copy**ToNum (Bit String to <br> Signed Integer) | Bit Pattern Copy (Bit String to <br> Real Number) Group | $2-341$ |
| Copy**To*** (Bit String to Real <br> Number) | Bit Pattern Copy (Signed Integer <br> to Bit String) Group | $2-343$ |
| CopyNumTo** (Signed Integer <br> to Bit String) | Bit Pattern Copy (Signed Integer <br> to Real Number) Group | $2-345$ |
| CopyNumTo** (Signed Integer <br> to Real Number) | Bit Pattern Copy (Real Number to <br> Bit String) Group | $2-347$ |
| Copy**To*** (Real Number to <br> Bit String) | Bit Pattern Copy (Real Number to <br> Signed Integer) Group | $2-349$ |
| Copy**ToNum (Real Number <br> to Signed Integer) |  |  |

## MOVE

The MOVE instruction moves the value of a constant or variable to another variable．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MOVE | Move | FUN | $(@) \mathrm{MOVE}$  <br> -EN ENO <br> -In Out | Out：＝In； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Move <br> source | Input | Move source | Depends on data type． | --- | $*$ |
| Out | Move <br> destination | Output | Move destination | Depends on data type． | --- | $*$ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

\hline
\end{tabular}

## Function

The MOVE instruction moves the value in move source In to move destination Out．The input parameter that is passed to In can be a variable or constant．You can specify an enumeration，array，array element， structure，or structure member for In．
The following figure shows a programming example．The content of variable abc is moved to variable def．

LD
＋1

ST
def：＝abc；

## Additional Information

- When moving an array, you can move either one element or all of the elements in the array. To move only one element, add the subscript to the array variable name. To move the entire array, do not add the subscript to the array variable name.

> Moving One Array Element

LD

ST def[5]:=abc[3];

Moving All Array Elements
LD ST
 def:=abc;

- When moving a structure, you can move either one member or all of the members in the structure. To move only one member, specify the member. To move the entire structure, give only the structure name.

Moving One Member of a Structure

LD

Moving the Entire Structure
LD
ST def:=abc;

- You can use the MemCopy instruction to move an entire array faster than with the MOVE instruction.

## Precautions for Correct Use

- The data types of In and Out can be different as long as they are both in one of the following groups. The valid range of Out must include the valid range of In.
- BYTE, WORD, DWORD, and LWORD
- USINT, UINT, UDINT, ULINT, SINT, INT, DINT, LINT, REAL, and LREAL
- If $I n$ is an enumeration, array element, structure, or structure member, then Out must have the same data type as In.
- If In is an array, an array of the same data type, size, and subscripts must be used for Out.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In is STRING data and it does not end in a NULL character.
- Out is STRING data, but the text string that is moved exceeds the size of Out.

## MoveBit

The MoveBit instruction moves one bit in a bit string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MoveBit | Move Bit | FUN |  | MoveBit（In，InPos，InOut， InOutPos）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Move source | Input | Move source | Depends on data type． | －－－ | ＊ |
| InPos | Move source bit |  | Position of bit in In to move | 0 to No．of bits in $\mathrm{In}-1$ |  |  |
| InOutPos | Move destination bit |  | Position of bit in Out to receive the bit | 0 to No．of bits in InOut － 1 |  | 0 |
| InOut | Move destination | In－out | Move destination | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { DO } \\ & \frac{0}{0} \\ & \frac{0}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 䍙 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 圌 } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\sum_{2}^{C}$ | $\underset{\substack{C}}{C}$ | $\frac{\text { 들 }}{\frac{0}{Z}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{N}{2}}_{\square}^{0}$ | $\overline{\sum_{1}}$ | $\begin{aligned} & \mathbb{D} \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 署 } \\ & \hline \end{aligned}$ | $\frac{-1}{\overline{3}}$ | $\begin{aligned} & \text { 밀 } \\ & \end{aligned}$ | 움 | 먹 | 号 |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InPos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOutPos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The MoveBit instruction moves one bit from the bit position InPos in move source In to the bit position InOutPos in move destination InOut.
The following example is for when InPos is USINT\#3 and InOutPos is USINT\#5.

## LD

## Precautions for Correct Use

- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut will not change.
- The value of $I n P o s$ is outside of the valid range.
- The value of InOutPos is outside of the valid range.

## MoveDigit

The MoveDigit instruction moves digits (4 bits per digit) in a bit string.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MoveDigit | Move Digit | FUN |  | MoveDigit(In, InPos, InOut, InOutPos, Size); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Move source | Input | Move source | Depends on data type. | --- | *1 |
| InPos | Move source digit |  | Position of digit in In to move | *2 |  |  |
| InOutPos | Move destination digit |  | Position of digit in Out to receive the digit | *3 |  | 0 |
| Size | Number of digits |  | Number of digits to move | *4 |  | 1 |
| InOut | Move destination | In-out | Move destination | Depends on data type. | --- | --- |
| Out | Return value | Output | Always TRUE | TRUE only | --- | --- |

*1 If you omit the input parameter, the default value is not applied. A building error will occur.
*2 0 to No. of bits in In/4-1
*3 0 to No. of bits in InOut/4-1
*4 0 to No. of bits in In/4

|  |  |  | Bit $\mathbf{s}$ | ing |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \text { a } \end{aligned}$ | dur | on |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D <br> 0 <br> 0 | $\underset{\substack{\text { D } \\ \hline \\ \hline}}{ }$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\underset{\sum_{1}}{\substack{C}}$ | $\underset{\substack{C}}{\substack{c}}$ | ${ }_{\frac{0}{3}}^{\text {둑 }}$ |  | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\bar{K}_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { m } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { 罠 } \\ & \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 목 } \\ & \text { m } \end{aligned}$ | 웅 | 먹 | 号 |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InPos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOutPos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The MoveDigit instruction moves Size digits from the InPos digit in move source In to the InOutPos digit in move destination InOut. One digit is four bits.
The following example is for when InPos is USINT\#1, InOutPos is USINT\#2, and Size is USINT\#2.

## LD

ST

MoveDigit(abc, USINT\#1, def, USINT\#2, USINT\#2);

## Precautions for Correct Use

- If the position of the digit at the destination exceeds the most-significant digit of InOut, the remaining digits are stored the least-significant digits of InOut .
- If the position of the digit at the source exceeds the most-significant digit of $I n$, the remaining digits are moved to the least-significant digits of $I n$.
- If the value of Size is 0 , the value of Out will be TRUE and InOut will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut will not change.
- The value of InPos is outside of the valid range.
- The value of InOutPos is outside of the valid range.
- The value of Size is outside of the valid range.

## TransBits

The TransBits instruction moves one or more bits in a bit string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TransBits | Move Bits | FUN |  | TransBits（In，InPos，InOut， InOutPos，Size）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Move source | Input | Move source | Depends on data type． | －－－ | ＊1 |
| InPos | Move source bit |  | Position of bit in In to move | ＊2 |  |  |
| InOutPos | Move destination bit |  | Position of bit in Out to receive the bit | ＊3 |  | 0 |
| Size | Number of bits |  | Number of bits to move | ＊ 4 |  | 1 |
| InOut | Move destination | In－out | Move destination | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊1 If you omit an input parameter，the default value is not applied．A building error will occur．
＊2 0 to No．of bits in In－1
＊3 0 to No．of bits in InOut－ 1
＊4 0 to No．of bits in In

|  |  |  | Bit $\mathbf{s}$ | ing |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \text { a } \end{aligned}$ | dur | on |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D <br> 0 <br> 0 | $\underset{\substack{\text { D } \\ \hline \\ \hline}}{ }$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\underset{\sum_{1}}{\substack{C}}$ | $\underset{\substack{C}}{\substack{c}}$ | ${ }_{\frac{0}{3}}^{\text {둑 }}$ |  | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\bar{K}_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { m } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { 罠 } \\ & \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 목 } \\ & \text { m } \end{aligned}$ | 웅 | 먹 | 号 |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| InOutPos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The TransBis instruction moves Size bits from the InPos bit in move source In to the InOutPos bit in move destination InOut.
The following example is for when InPos is USINT\#3, InOutPos is USINT\#4, and Size is USINT\#2.

## LD

## ST

TransBits(abc, USINT\#3, def, USINT\#4, USINT\#2);

## Additional Information

The bits in the move source and move destination can overlap.

## Precautions for Correct Use

- Set the instruction so that the positions of the bits at the source and destination do not exceed the most-significant bit in In or InOut. An error will occur and the instruction will not operate.
- Nothing is moved if the value of Size is 0 .
- The bits in InOut that are not involved in the move operation do not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut will not change.
- The value of InPos is outside of the valid range.
- The value of InOutPos is outside of the valid range.
- The value of Size is outside of the valid range.
- The value of InPos or Size exceeds the number of bits in In.
- The value of InOutPos or Size exceeds the number of bits in InOut.

## MemCopy

The MemCopy instruction moves one or more array elements．The move source and move destination must have the same data type．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MemCopy | Memory Copy | FUN |  | MemCopy（In，AryOut，Size）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In［］（array） | Move source array | Input | Move source array | Depends on data type． | －－－ | ＊ |
| Size | Number of elements |  | Number of array elements to move |  |  | 1 |
| AryOut［］ （array） | Move destination array | In－out | Move destination array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | ロ <br> $\stackrel{\circ}{0}$ <br> $\stackrel{0}{3}$ <br>  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| ［ | OK | OK | OK | OK | OK | OK | OK | OK | OK | ОК | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| Int（aray） | Arrays of enumerations or structures can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be an array with the same data type as $\ln []$. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The MemCopy instruction moves Size elements of move source array $\operatorname{In}[]$ starting from $\operatorname{In}[0]$ to move destination array AryOut[] starting from AryOut[0].
The following example is for when Size is UINT\#3.

## Additional Information

- You can specify different positions in the same array for In[] and AryOut[]. The source and destination data can overlap.
The following example is for when In is A[2], AryOut is A[4], and Size is UINT\#3.

- Use the AryMove instruction (page 2-335) if the source and destination have different data types.
- If the data types of $\operatorname{In}[]$ and AryOut[] are the same, this instruction is faster than the AryMove instruction.
- Use the MOVE instruction (page 2-318) to move variables that are not arrays.

## Precautions for Correct Use

- Use the same data type for $\operatorname{In}[]$ and AryOut[]. If they are different, a building error will occur.
- If $I n[]$ and AryOut[] are STRING arrays, their sizes must be the same.
- If the value of Size is 0 , the value of Out will be TRUE and AryOut[] will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- Size exceeds the array area of $\operatorname{In}[]$.
- Size exceeds the array area of AryOut[].

## SetBlock

The SetBlock instruction moves the value of a variable or constant to one or more array elements．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SetBlock | Block Set | FUN |  | SetBlock（In，AryOut，Size）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Move source | Input | Move source | Depends on data type． | －－－ | ＊ |
| Size | Number of elements |  | Number of array elements to move |  |  | 1 |
| AryOut［］ （array） | Move destination array | In－out | Move destination array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { 品 } \\ & \frac{0}{0} \\ & \stackrel{\sim}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ |  | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 00 \end{aligned}$ | 号 | $\frac{\mathfrak{N}}{\sum_{1}}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\substack{\mathrm{Z}}}{\text { 든 }}$ | $\frac{\mathrm{C}}{\underset{Z}{\mathrm{Z}}}$ | $\sum_{-1}^{\infty}$ | $\underset{1}{ }$ | $\frac{0}{2}$ | $\bar{Z}_{-1}^{\Gamma}$ | $\xrightarrow{\text { m }}$ | 「 m \％ | － | 号 | 음 | 먹 | 号 2 0 |
|  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| In | An enumeration，structure，or structure member can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | Must be an array with elements that have the same data type as In． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The SetBlock instruction moves the value of move source In to Size locations in move destination array AryOut［］starting from AryOut［0］．

The following example is for when Size is UINT\#3.

## Precautions for Correct Use

- Use the same data type for In and AryOut[]. If they are different, a building error will occur.
- If In and AryOut[] are STRING data, their sizes must be the same.
- If the value of Size is 0 , the value of Out will be TRUE and AryOut[] will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE, and AryOut[] will not change.
- The value of Size exceeds the array area of AryOut[].

## Exchange

The Exchange instruction exchanges the values of two variables．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Exchange | Data Exchange | FUN |  | Exchange（InOut1，InOut2）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| InOut1 and <br> InOut2 | Data to <br> exchange | In－out | Data to exchange | Depends on data type． | --- | --- |
| Out | Return <br> value | Output | Always TRUE | TRUE only | --- | --- |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \text { 罦 } \\ & \hline \end{aligned}$ | $\sum$ O D | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & 0 \\ & 0 \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\underset{1}{C}}{\substack{C}}$ |  | $\underset{\underset{1}{C}}{\stackrel{C}{c}}$ | ${\underset{\sim 1}{\infty}}_{\infty}^{\infty}$ | $\bar{z}_{1}$ | $\sum_{i 1}^{0}$ | $\bar{Z}_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \stackrel{N}{\mathbb{N}} \end{aligned}$ | 「 m T | －긏 | 号 | 음 | 먹 |  |
| InOut1 | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
|  | An enumeration，structure，or structure member can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut2 | Must be same data type as InOut1． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The Exchange instruction exchanges the values of data to exchange InOut1 and InOut2．You can spec－ ify enumerations，structures，or structure members for InOut1 and InOut2．
The following figure shows a programming example．The values in variables abc and def are exchanged．

LD

ST

Exchange（abc，def）；

## Precautions for Correct Use

- The data types of InOut1 and InOut2 must be the same. If they are different, a building error will occur.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut1 and InOut2 will not change.
- Both InOut1 and InOut2 are STRING data and the length of the text string in one of them does not fit into the other.
- InOut1 and InOut2 contain different data types.

## AryExchange

The AryExchange instruction exchanges the elements of two arrays．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryExchange | Array Data Exchange | FUN |  | AryExchange（InOut1， InOut2，Size）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Size | Number of <br> elements | Input | Number of elements to <br> exchange | Depends on data type． | --- | 1 |
| InOut1［］ <br> and <br> InOut2［］ <br> （arrays） | Arrays to <br> exchange | In－out | Arrays to exchange | Depends on data type． | --- | --- |
| Out | Return <br> value | Output | Always TRUE | TRUE only | --- | --- |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  | $\begin{aligned} & \text { J } \\ & \frac{1}{3} \\ & \frac{3}{3} \\ & \frac{0}{0} \\ & \stackrel{N}{\omega} \end{aligned}$ |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 <br> 0 <br> 0 |  | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\frac{\text { ¢ }}{\underset{Z}{C}}$ | $\underset{\substack{\mathrm{K}}}{\text { ᄃ }}$ |  | $\frac{\mathrm{C}}{\sum_{1}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\underset{\sim}{\underline{1}}$ | $\underset{\text { 믁 }}{ }$ | $\bar{Z}_{-1}$ | $\begin{aligned} & \text { D } \\ & \stackrel{\pi}{D} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 而 } \end{aligned}$ | $\stackrel{-1}{\overline{1}}$ | 号 | 음 | 먹 | 足 |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut1［］ | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| （array） |  |  |  |  |  | rays | f en | mera | tions | or str | cture | can | also | be sp | cifie |  |  |  |  |  |
| InOut2［］ （array） |  |  |  |  |  | Must | be | arra | with | the | same | ata | pe | InO | t1［］． |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryExchange instruction exchanges Size elements from InOut1［0］of array to exchange InOut1［］ with Size elements from InOut2［0］of array to exchange InOut2［］．

The following example is for when Size is UINT\#2.

## Additional Information

- Use the MOVE instruction (page 2-318) to assign constants to variables.
- Use the MemCopy instruction (page 2-327) to copy the values of variables to other variables.

## Precautions for Correct Use

- Use the same data type for the elements of InOut1[] and InOut2[]. If they are different, a building error will occur.
- If the value of Size is 0 , the value of Out will be TRUE and InOut1[] and InOut2[] will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut1[] and InOut2[] will not change.
- The value of Size exceeds the array range of InOut1[] or InOut2[].
- InOut1[] and InOut2[] are STRING arrays and there is an element with a text string that exceeds the size of the element in the other array.
- InOut1[] and InOut2[] are STRING arrays and there is an element that does not end in a NULL character.

## AryMove

The AryMove instruction moves one or more array elements．The data types of the move source and move destination can be different．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryMove | Array Move | FUN |  | AryMove（In，AryOut，Size）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In［］（array） | Move source array | Input | Array to move | Depends on data type． | －－－ | ＊ |
| Size | Number of elements |  | Number of elements to move |  |  | 1 |
| AryOut［］ （array） | Move result array | In－out | Move result array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { © } \\ & \stackrel{0}{0} \\ & \stackrel{0}{0} \\ & \stackrel{O}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \text { 眔 } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { D } \end{aligned}$ | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{خ}{\top}}_{\substack{C}}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\sum_{-1}^{C}$ | $\underset{\underset{1}{C}}{\stackrel{C}{c}}$ | ${\underset{-1}{\infty}}_{\substack{\infty}}$ | $\underset{1}{\underline{1}}$ | $\underset{\sim}{2}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \\ & \end{aligned}$ | 「 <br> T <br> T | 긏 | 号 | －1 | 먹 |  |
| In［1 | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| If（array） | Arrays of enumerations or structures can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
|  | Arrays of enumerations or structures can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryMove instruction moves Size elements of move source array In［］starting from In［0］to move result array AryOut［］starting from AryOut［O］．The data types of In［］and AryOut［］can be different．

The following example is for when Size is UINT\#2.

## Additional Information

- If the data types of $\operatorname{In}[]$ and AryOut[] are the same, the MemCopy instruction is faster.
- You can specify the same array for In[] and AryOut[]. Also, the move source and destination data can overlap. The following example is for when $\operatorname{In}[0]$ is $A[2]$, AryOut[0] is A[4], and Size is UINT\#3.

| Size=UINT\#3 | $\mathrm{A}[0]$ | 1234 | A[0] | 1234 |
| :---: | :---: | :---: | :---: | :---: |
|  | A[1] | 2345 | A[1] | 2345 |
|  | $\mathrm{In}=\mathrm{A}[2]$ | 3456 | $\mathrm{In}=\mathrm{A}[2]$ | 3456 |
|  | A[3] | 4567 | A[3] | 4567 |
|  | AryOut=A[4] | 5678 | Out=A[4] | 3456 |
|  | A[5] | 6789 | A[5] | 4567 |
|  | A[6] | 7890 | A[6] | 5678 |

## Precautions for Correct Use

- The data types of $\operatorname{In}[]$ and AryOut[] can be different as long as they are both in one of the following groups. The valid range of AryOut [] must include the valid range of $\operatorname{In}[]$.
- BYTE, WORD, DWORD, and LWORD
- USINT, UINT, UDINT, ULINT, SINT, INT, DINT, LINT, REAL, and LREAL
- If $\operatorname{In}[]$ is an array of structures, use the same data types for $\operatorname{In}[]$ and AryOut[].
- If the value of Size is 0 , the value of Out will be TRUE and AryOut[] will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE, and AryOut[] will not change.
- The value of Size exceeds the size of In[] or AryOut[].
- In[] and AryOut[] are STRING arrays and one of the elements to move does not end in a NULL character.
- In[] or AryOut[] is a STRING array and the length of a text string in an element to move exceeds the size of the element in AryOut[].

## Clear

The Clear instruction initializes a variable．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Clear | Initialize | FUN |  | Clear（InOut）； |

## Variables

## Function

The Clear instruction initializes the value of data to initialize InOut．
If an initial value attribute is set for a variable，the specified initial value is used．If an initial value attribute is not set，the default value for the data type is used．
The default values for the data types are given below．

| Data type | Default |
| :--- | :--- |
| BOOL | FALSE |
| BYTE，WORD，DWORD，or LWORD | $16 \# 0$ |
| USINT，UINT，UDINT，ULINT，SINT，INT，DINT，LINT， | 0 |
| REAL，or LREAL | T\＃0ms |
| TIME | D\＃1970－1－1 |
| DATE | TOD\＃0：0：0 |
| TOD | DT\＃1970－1－1－0：0：0 |
| DT | $"$ |
| STRING |  |

If InOut is an array, array element, structure, or structure member, the following processing is performed.

| InOut | Processing |
| :--- | :--- |
| Array | All elements in the array are initialized. |
| Array element | Only the specified element is initialized. |
| Structure | All members in the structure are initialized. |
| Structure member | Only the specified member is initialized. |

The following figure shows a programming example. The value of variable abc is initialized.

LD

ST
Clear(abc);

## Additional Information

- If InOut is an array that is used as a stack, execute this instruction and also set the variable that manages the number of items stored in the stack to 0 .
- If you initialize a cam data variable with this instruction, it will not contain the data that was saved with the MC_SaveCamTable instruction. It will contain all zeros.

## Precautions for Correct Use

Return value Out is not used when the instruction is used in ST.

## Copy＊＊ToNum（Bit String to Signed Integer）

The Copy＊＊ToNum instruction copies the content of a bit string directly to a signed integer．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Copy＊＊ToNum | Bit Pattern Copy （Bit String to Signed Integer）Group | FUN |  | Out：＝Copy＊＊ToNum（In）； ＂＊＊＊＂must be a bit string data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Copy <br> source | Input | Copy source | Depends on data type． | --- | 0 |
| Out | Copy <br> destination | Output | Copy destination | Depends on data type． | --- | --- |

|  | $\begin{aligned} & \text { © } \\ & \underline{0} \\ & \frac{0}{0} \\ & \end{aligned}$ |  | Bit s | rings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \text { ar } \end{aligned}$ | dur | str |  |

## Function

The Copy＊＊ToNum instruction copies the content of copy source In directly to copy destination Out．
There are four instructions depending on the data types of In and Out．

| In | Out | Instruction |
| :--- | :--- | :--- |
| BYTE | SINT | CopyByteToNum |
| WORD | INT | CopyWordToNum |
| DWORD | DINT | CopyDwordToNum |
| LWORD | LINT | CopyLwordToNum |

The following example for the CopyWordToNum instruction is for when In is WORD\#16\#4D2.

In

| WORD\#16\#4D2 <br> $($ WORD\#2\#00000100_11010010 $)$$\longrightarrow$ Out $=$ abc |
| :--- | | INT\#1234 |
| :--- |
| $\left(2 \# 00000100 \_11010010\right)$ |

## Copy＊＊To＊＊＊（Bit String to Real Number）

The Copy＊＊To＊＊＊instruction copies the content of a bit string directly to a real number．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Copy＊＊To＊＊＊ | Bit Pattern Copy （Bit String to Real Number）Group | FUN |  | ```Out:=CopyDwordToReal(In); or Out:=CopyLwordToLreal(In);``` |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Copy <br> source | Input | Copy source | Depends on data type． | --- | 0 |
| Out | Copy <br> destination | Output | Copy destination | Depends on data type． | --- | --- |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O <br> O | $\begin{aligned} & \text { 四 } \\ & \text { 而 } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 0 0 0 0 0 | K O O O | $\underset{\sum_{1}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | ${ }_{-1}^{\text {득 }}$ | $\underset{\underset{1}{c}}{\stackrel{C}{5}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\text { 민 }}{ }$ | $\sum_{-1}$ | $\begin{aligned} & \text { J } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \$ \end{aligned}$ | $\frac{-1}{2}$ | 号 | 음 | 막 |  |
| In |  |  |  | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | Must be REAL if the data type of In is DWORD and LREAL if the data type of In is LWORD． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The Copy**To*** instruction copies the content of copy source In directly to copy destination Out. There are two instructions depending on the data types of In and Out.

| In | Out | Instruction |
| :--- | :--- | :--- |
| DWORD | REAL | CopyDwordToReal |
| LWORD | LREAL | CopyLwordToLreal |

The following example for the CopyDwordToReal instruction is for when In is DWORD\#16\#40200000.

## CopyNumTo＊＊（Signed Integer to Bit String）

The CopyNumTo＊＊instruction copies the content of a signed integer directly to a bit string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CopyNumTo＊＊ | Bit Pattern Copy （Signed Integer to Bit String）Group | FUN |  | Out：＝CopyNumTo＊＊（In）； ＂＊＊＂must be a bit string data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| In |  |  |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |
| Out | Must be DINT if the data type of $I n$ is REAL and LINT if the data type of $I n$ is LREAL. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The Copy**ToNum instruction copies the content of copy source In directly to copy destination Out. There are two instructions depending on the data types of In and Out.

| In | Out | Instruction |
| :--- | :--- | :--- |
| REAL | DINT | CopyRealToNum |
| LREAL | LINT | CopyLrealToNum |

The following example for the CopyRealToNum instruction is for when In is REAL\#2.5.

In
$\begin{aligned} & \text { REAL\#2.5 } \\ & \left(2 \# 01000000 \_00100000 \_00000000 \_00000000\right)\end{aligned}$$\longrightarrow$ Out $=$ abc $\begin{aligned} & \text { DINT\#1075838976 } \\ & \left(2 \# 01000000 \_00100000 \_00000000 \_00000000\right)\end{aligned}$

## Shift Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| AryShiftReg | Shift Register | $2-352$ |
| AryShiftRegLR | Reversible Shift Register | $2-354$ |
| ArySHL and ArySHR | Array N-element Left Shift/ <br> Array N-element Right Shift | $2-357$ |
| SHL and SHR | N-bit Left Shift/ <br> N-bit Right Shift | $2-360$ |
| NSHLC and NSHRC | Shift N-bits Left with Carry/ <br> Shift N-bits Right with Carry | $2-362$ |
| ROL and ROR | Rotate N-bits Left/ <br> Rotate N-bits Right | $2-364$ |

## AryShiftReg

The AryShiftReg instruction shifts a shift register one bit to the left and inserts the input value to the least-significant bit. The shift register consists of array elements.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryShiftReg | Shift Register | FB |  | AryShiftReg_instance(Shift, Reset, In, InOut, Size); |

## Variables

| Name | Meaning | 1/0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Shift | Shift | Input | Shifted when signal changes to TRUE. | Depends on data type. | --- | FALSE |
| Reset | Reset |  | TRUE: Register is reset. |  |  |  |
| In | Input value |  | Value to insert to least-significant bit of InOut[]. |  |  |  |
| Size | Number of elements in array of bit strings |  | Number of elements to use as a shift register in InOut[]. |  |  | 1 |
| InOut[] (array) | Array of bit strings | In-out | Array of bit strings | Depends on data type. | --- | --- |

## Function

The AryShiftReg instruction shifts Size array elements in the array of bit strings InOut[] to the left (i.e., toward most-significant bit) when Shift changes to TRUE. The shift operation starts from InOut[0]. Input value $I n$ is inserted to the least-significant bit. The most-significant bit of the array of bit strings is output to the Carry (CY) Flag (P_CY).

The following example is for when InOut[] is a BYTE array and Size is UINT\#2.

LD ST

AryShiftReg_instance(A, abc, def, ghi[1], UINT\#2);

|  | Size=UINT\#2 |  |
| :---: | :---: | :---: |
|  | $\begin{aligned} & \text { InOut[1]=ghi[2] } \\ & 11010 \mid 1010] \end{aligned}$ | $\begin{aligned} & \text { InOut[0]=ghi[1] } \\ & {[1\|10\| 1\|0\| 0\|1\| 1]} \end{aligned}$ |
| $\begin{gathered} \mathrm{P}_{-} \mathrm{CY} \\ 1 \end{gathered}$ |  |  |

Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| P_CY | Carry (CY) Flag | BOOL | Value stored in Carry Flag |

## Precautions for Correct Use

- While Reset is TRUE, the register is not shifted even if Shift changes to TRUE.
- ENO will change to TRUE when Shift changes to TRUE and the shift operation is performed normally, or when Reset is TRUE and the reset operation is performed normally.
- The InOut[] does not change if the value of Size is 0 .
- An error occurs in the following case. ENO will be FALSE, and InOut[] will not change.
- The value of Size exceeds the array area of InOut[].

## AryShiftRegLR

The AryShiftRegLR instruction shifts a bit string one bit to the left or right and inserts the input value to the least－significant or most－significant bit．The bit string consists of array elements．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryShiftRegLR | Reversible Shift Register | FB |  | AryShiftRegLR＿instance （ShiftL，ShiftR，Reset，In， InOut，Size）； |

| InOut［］ （array） | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryShiftRegLR instruction shifts Size array elements of array of bit strings InOut[] to the left when ShiftL changes to TRUE. The shift operation starts from InOut[0]. Input value In is inserted to the leastsignificant bit. The most-significant bit of the array of bit strings is output to the Carry (CY) Flag (P_CY).

When ShiftR changes to TRUE, the bits are shifted one bit to the right and In is inserted to the most-significant bit. The least-significant bit of the array of bit strings is output to the Carry (CY) Flag (P_CY).

When Reset is TRUE, P_CY and all of the bits in Size elements starting from InOut[0] are set to FALSE.

The following example is for when InOut is BYTE data, Size is UINT\#2 and ShiftL changes to TRUE.
LD ST

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| P_CY | Carry (CY) Flag | BOOL | Value stored in Carry Flag |

## Precautions for Correct Use

- While Reset is TRUE, the register is not shifted even if ShiftL or ShiftR changes to TRUE.
- The register is not shifted if both ShiftL and ShiftR change to TRUE at the same time.
- ENO will change to TRUE when ShiftL or ShiftR changes to TRUE and the shift operation is performed normally, or when Reset is TRUE and the reset operation is performed normally.
- The InOut[] does not change if the value of Size is 0 .
- An error occurs in the following case. ENO will be FALSE, and InOut[] will not change.
- The value of Size exceeds the array area of InOut[].

## ArySHL and ArySHR

These instructions shift array elements by one or more elements．
ArySHL：Shifts the array to the left（toward the higher elements）．
ArySHR：Shifts the array to the right（toward the lower elements）．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ArySHL | Array N－element Left Shift | FUN |  | ArySHL（InOut，Size，Num）； |

## Function

These instructions shift the upper Size elements in shift register array InOut[] by Num elements. The values that are shifted out of the array are discarded.
The default value for the data type of InOut[] is stored in the empty elements. If an initial value attribute is set for InOut[], the specified initial value is used. If an initial value attribute is not set, the default value for the data type is used. If InOut[] is an array of structures, the members of the structures in all elements are initialized.
The default values for the data types are given below.

| Data type of InOut | Default |
| :--- | :--- |
| BOOL | FALSE |
| BYTE, WORD, DWORD, or LWORD | $16 \# 0$ |
| USINT, UINT, UDINT, ULINT, SINT, INT, DINT, LINT, <br> REAL, or LREAL | 0 |
| TIME | T\#0ms |
| DATE | D\#1970-1-1 |
| TOD | TOD\#0:0:0 |
| DT | DT\#1970-1-1-0:0:0 |
| STRING |  |

## - ArySHL

The ArySHL instruction shifts the array to the left (toward the higher elements of the array).

## - ArySHR

The ArySHR instruction shifts the array to the right (toward the lower elements of the array). The following example shows the ArySHL instruction when Size is UINT\#6 and Num is UINT\#2.

LD

ST

ArySHL(abc[1], UINT\#6, UINT\#2);

## Additional Information

If InOut[] is BOOL data, the results will be the same as shifting a bit string of Size bits by Num bits.

## Precautions for Correct Use

- The shift operation is not performed if the value of Num is 0 .
- If the value of Num is larger than Size, all values from InOut[0] to InOut[Size-1] are initialized.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE, and InOut[] will not change.
- The value of Size exceeds the array area of InOut[].

## SHL and SHR

These instructions shift a bit string by one or more bits.
SHL: Shifts the bit string to the left (toward the higher bits).
SHR: Shifts the bit string to the right (toward the lower bits).

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SHL | N-bit Left Shift | FUN |  | Out:=SHL(In, Num); |
| SHR | N-bit Right Shift | FUN |  | Out:=SHR(In, Num); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> shift | Input | Data to shift | Depends on data type. | --- | $*$ |
|  |  |  | 0 to No. of bits in In | Bits | 1 |  |
| Num | Number to <br> shift |  | Dut | Processing <br> result | Output | Processing result |

* If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

These instructions shift data to shift In (bit string data) by the number of bits specified in number to shift Num. The bits that are shifted out of the register are discarded and zeros are inserted into the other end of the register.

## - SHL

The SHL instruction shifts bits from right to left (from least-significant to most-significant bits).

The following example if for when In is BYTE\#16\#89 and Num is USINT\#2.

```
LD ST
```

```
Bit 7 Bit 0
abc:=SHL(BYTE\#16\#89, USINT\#2);
In \(10000010 \mid 011 \longrightarrow\) Out \(=\) abc \(000110|0| 1|0| 0\)
```

```
Shifted 2 bits left.
Zeros inserted to lower 2 bits.
```

## - SHR

The SHR instruction shifts bits from left to right (from most-significant to least-significant bits).
The following example shows the SHR instruction when In is BYTE\#16\#89 and Num is USINT\#2.

## LD <br> ST

abc:=SHR(BYTE\#16\#89, USINT\#2);

## Additional Information

The ROL and ROR instructions insert the bits that are shifted out of the register into the other end of the register.

## Precautions for Correct Use

- The data types of In and Out must be the same.
- If Num is 0 , an error will not occur and the value of In will be assigned directly to Out.
- If the value of Num exceeds the number of bits specified in In, an error will not occur and the value of Out will be 16\#0.

## NSHLC and NSHRC

These instructions shift an array of bit strings by one or more bits．The Carry（CY）Flag is included． NSHLC：$\quad$ Shifts the array to the left（toward the higher elements）．
NSHRC：$\quad$ Shifts the array to the right（toward the lower elements）．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| NSHLC | Shift N－bits Left with Carry | FUN |  | NSHLC（InOut，Size，Num）； |
| NSHRC | Shift N－bits Right with Carry | FUN |  | NSHRC（InOut，Size，Num）； |

## Variables

| Name | Meaning |  |  |  |  | Description |  |  |  |  | Valid range |  |  |  |  | Unit |  |  | Default |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Size | Number of bits in shift register |  |  | Input |  | Number of bits in shift register |  |  |  |  | Depends on data type． |  |  |  |  | Bits |  |  | 1 |  |
| Num | Number of bits to shift |  |  |  |  | Number of bits to shift |  |  |  |  |  |  |  |  |  |  |  |  |

| Size |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut［］ （array） | OK | OK | OK | K OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

These instructions shift Size array elements in shift register array InOut[] by the number of bits specified in Num. The shift register starts at InOut[0]. The last bit that is shifted out of the register is output to the Carry (CY) Flag. Zeros are inserted for the bits at the other end.

## - NSHLC

The NSHLC instruction shifts bits from the lower elements in the array to the higher elements and from the least-significant bits to the most-significant bits.

## - NSHRC

The NSHRC instruction shifts bits from the higher elements in the array to the lower elements and from the most-significant bits to the least-significant bits.
The following example shows the NSHLC instruction when InOut[] is a BYTE array, Size is USINT\#80 and Num is USINT\#3.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| P_CY | Carry (CY) Flag | BOOL | Value stored in Carry Flag |

## Precautions for Correct Use

- The shift operation is not performed if the value of Num is 0 .
- If the value of Num is larger than Size, Size bits from bit 0 of InOut[0] are changed to FALSE. The value of the Carry Flag (CY) changes to FALSE.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE, and InOut[] will not change.
- The value of Size exceeds the array area of InOut[].

## ROL and ROR

These instructions rotate a bit string by one or more bits.
ROL: Rotates the bit string to the left (toward the higher bits).
ROR: Rotates the bit string to the right (toward the lower bits).

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ROL | Rotate N -bits Left | FUN |  | Out:=ROL(In, Num); |
| ROR | Rotate N-bits Right | FUN |  | Out:=ROR(In, Num); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> rotate | Input | Data to rotate | Depends on data type. | --- | $*$ |
|  |  |  | 0 to No. of bits in In | Bits | 1 |  |
| Num | Number of <br> bits |  | Dut | Processing <br> result | Output | Processing result |

* If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

These instructions rotate data to rotate In (bit string data) by the number of bits specified in number of bits Num. Bits that are shifted out of the register are inserted into the other end of the register.

## - ROL

The ROL instruction rotates bits from right to left (from least-significant to most-significant bits).

The following example is for when In is BYTE\#16\#89 and Num is USINT\#2.

## - ROR

The ROR instruction rotates bits from left to right (from most-significant to least-significant bits).
The following example shows the ROR instruction when In is BYTE\#16\#89 and Num is USINT\#2.

## Additional Information

The SHL and SHR instructions discard the bits that are shifted out of the register and insert zeros into the other end of the register.

## Precautions for Correct Use

- The data types of In and Out must be the same.
- If Num is 0 , an error will not occur and the value of In will be assigned directly to Out.
- If the value of Num exceeds the number of bits specified in In, an error will not occur and the bits will be rotated by the number of bits specified in Num. For example, if In is WORD data, the value of Out will be the same regardless of whether the value of Num is USINT\#1 or USINT\#17.

2 Instruction Descriptions

## Conversion Instructions

| Instruction | Name | Page | Instruction | Name | Page |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Swap | Swap Bytes | $2-368$ | FixNumToString | Fixed-decimal Number-to-Text String Conver- <br> sion | $2-428$ |
| Neg | Reverse Sign | $2-369$ | StringToFixNum | Text String-to-Fixed-decimal Conversion |  |
| Decoder | Bit Decoder | $2-371$ | DtToString | Date and Time-to-Text String Conversion | $2-433$ |
| Encoder | Bit Encoder | $2-374$ | DateToString | Date-to-Text String Conversion | $2-435$ |
| BitCnt | Bit Counter | $2-376$ | TodToString | Time of Day-to-Text String Conversion | $2-436$ |

## Swap

The Swap instruction swaps the upper byte and lower byte of a 16-bit value.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Swap | Swap Bytes | FUN |  | Out:=Swap(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | Depends on data type. | --- | 0 |
| Out | Conver- <br> sion result | Output | Conversion result | Depends on data type. | --- | --- |

## Function

The Swap instruction swaps the upper byte and lower byte of data to convert In and assigns the result to conversion result Out.
The following example is for when In is WORD\#16\#1234.
LD
ST
abc:=Swap(WORD\#16\#1234);

## Neg

The Neg instruction reverses the sign of a number.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Neg | Reverse Sign | FUN | $-\mathrm{EN} \quad \mathrm{ENO}$  <br> -In Out | Out:=Neg(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | Depends on data type. | --- | * |
| Out | Conver- <br> sion result | Output | Conversion result | Depends on data type. | --- | --- |

* If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

The Neg instruction reverses the sign of data to convert $I n$. The value of Out depends on the data type of $I n$.

| Data type of $\boldsymbol{I n}$ | Value of Out |
| :--- | :--- |
| Signed integer: | All bits in In are reversed and then 1 is <br> added. (This is the same as multiplying <br> In by -1.$)$ |
| SINT, INT, DINT, or LINT | All bits in In are reversed and then 1 is <br> added. |
| Unsigned integers:  <br> USINT, UNIT, UDINT, or ULINT In $\times(-1)$ <br> Real numbers:  <br> REAL or LREAL  |  |

The following example is for when In is INT\#123.

Bits reversed and 1 added.
In $123\left(2 \# 0000 \_0000 \_0111 \_1011\right) \longrightarrow$ Out $=$ abc $-123\left(2 \# 1111 \_1111 \_1000 \_0101\right)$

The following example is for when In is UINT\#123.
In 123(2\#0000_0000_0111_1011)
Bits reversed and 1 added.

## Precautions for Correct Use

If you use a different data type for In and Out, make sure the valid range of Out includes the valid range of In. Otherwise, an error will not occur and the value of Out will be an illegal value. For example, if the value of $I n$ is SINT\#-128 and the data type of Out is INT, the value of Out will be INT\#-128 instead of INT\#128.

## Decoder

The Decoder instruction sets the specified bit to TRUE and the other bits to FALSE in array elements that consist of a maximum of 256 bits．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Decoder | Bit Decoder | FUN |  | Decoder（In，Size，InOut）； |

Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  |  | Bit $\mathbf{s}$ | rings |  |  |  |  | Inte |  |  |  |  |  |  |  | imes | dur | io |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ⿴囗十 O 응 | $\begin{aligned} & \text { 䍗 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 믕 O D | ミ O 召 | ${\underset{Z}{2}}_{\substack{C}}$ | $\underset{\substack{C}}{\substack{0}}$ | $\frac{\text { 득 }}{\underset{1}{2}}$ |  | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ |  | $\frac{-1}{3}$ | 号 | 음 | 먹 | 号 |
| In |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut［］ （array） | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The Decoder instruction converts array elements with 2 Size bits that start from InOut［0］in array to con－ vert InOut［］．It sets the specified bit to TRUE．It sets the other bits to FALSE．The bit to make TRUE is specified by the Size bits in the lower byte of conversion bit position In．Always attach the element num－ ber to the in－out parameter that is passed to InOut［］，e．g．，array［3］．
Consider an example where In is BYTE\＃16\＃09，Size is USINT\＃4，and InOut［］is a BYTE array．The value of the Size bits in the lower bits of $I n$ is $16 \# 9$ ，which is 9 decimal．Therefore，the ninth bit from the least－significant bit of $\operatorname{InOut}[]$ is made TRUE and the other bits are made FALSE．

InOut[] is a BYTE array, so the ninth bit from the least-significant bit is bit 1 in InOut[1]. Therefore, bit 1 in InOut[1] is made TRUE, all other bits in InOut[1] are made FALSE, and all bits in InOut[0] are made FALSE.

If the number of bits in the elements of InOut[] is larger than the number of bits specified by Size, the values of the remaining bits are retained. Consider an example where In is BYTE\#16\#02, Size is USINT\#2, and InOut[] is a WORD array.
Size is USINT\#2, so the value is set in the lower 4 bits of InOut[0]. The values of the remaining bits in InOut[O] (bits 4 to 15) are retained.

## Additional Information

Use the Encoder instruction (page 2-374) to find the position of the highest TRUE bit in array elements that consist of a maximum of 256 bits.

## Precautions for Correct Use

- If the value of Size is 0 , all bits in InOut[] change to FALSE.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut[] will not change.
- The value of Size is outside of the valid range.
- The value of Size exceeds the array area of InOut[].
- InOut[] is not a BOOL array or an array of bit strings.
- An array without a subscript is passed to InOut[].

## Encoder

The Encoder instruction finds the position of the highest TRUE bit in array elements that consist of a maximum of 256 bits．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Encoder | Bit Encoder | FUN |  | Out：＝Encoder（In，Size）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In［］（array） | Array to convert | Input | Array to convert | Depends on data type． | －－－ | ＊ |
| Size | Bits to convert |  | Number of bits to convert | 0 to 8 | Bits | 1 |
| Out | Conver－ sion result | Output | Conversion result | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |

| Out |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The Encoder instruction finds the position of a TRUE bit in a specified range of bits in array to convert $\operatorname{In}[]$ ．The instruction looks for a TRUE bit in 2 Size bits from In［0］．The position of the TRUE bit in this range is expressed in binary and stored in the Size bits in the lower bits of conversion result Out．FALSE is stored in the remaining bits of Out．
If there is more than one TRUE bit in the specified range，the position of the highest bit that is TRUE is found．Always attach the element number to input parameter that is passed to In［］，e．g．，array［3］．
Consider an example for when Size is USINT\＃4 and In［］is a BYTE array．Size is USINT\＃4，so the range in which to find a TRUE bit is $2^{4}$ ，or 16 bits，from $\operatorname{In}[0]$ ．In the following diagram，the ninth bit in the range is TRUE．

Size is USINT\#4, so 2\#1001 (i.e., 9) is stored in the lower 4 bits of Out. FALSE is stored in the upper four bits of Out.

## Additional Information

Use the Decoder instruction (page 2-371) to make one bit TRUE and the other bits FALSE in array elements that consist of a maximum of 256 bits.

## Precautions for Correct Use

- If the value of Size is 0 , all bits in Out change to FALSE.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Size is outside of the valid range.
- The value of Size exceeds the array area of In[].
- The value of all bits in $\operatorname{In}[]$ that are specified by Size change to FALSE.
- In[] is not a BOOL array or an array of bit strings.
- An array without a subscript is passed to $\operatorname{In}[]$.

## BitCnt

The BitCnt instruction counts the number of TRUE bits in a bit string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| BitCnt | Bit Counter | FUN |  | Out：＝BitCnt（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Count <br> string | Input | String in which to count <br> TRUE bits | Depends on data type． | --- | ＊ |
| Out | Count <br> result | Output | Number of TRUE bits | 0 to No．of bits in In | --- | --- |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | （1） 을 On |  | Bit st | ings |  |  |  |  | Integ |  |  |  |  |  |  |  | imes |  |  |  |

| Out |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The ColmToLine＿＊＊instruction extracts bit values from the specified position of array elements and out－ puts them in order as a bit string．
First，Size elements are extracted from array to convert $\operatorname{In}[]$ starting from $\operatorname{In}[0]$ ．Then，only the values of bits in Pos are extracted．These are placed in order in a bit string of Size bits and stored in conversion result Out from the least－significant bit．FALSE is stored in the remaining bits of Out．
The name of the instruction is determined by the data type of Out．For example，if Out is the BYTE data type，the instruction is ColmToLine＿BYTE．
Always attach the element number to input parameter that is passed to $\operatorname{In}[]$, e．g．，array［3］．

The following example shows the ColmToLine_BYTE instruction when Pos is USINT\#3 and Size is USINT\#4.
LD
ST
def:=ColmToLine_BYTE(abc[3], USINT\#4, USINT\#3);

## Additional Information

Use the LineToColm instruction (page 2-379) to output a bit string to the specified bit position in array elements.

## Precautions for Correct Use

- If the value of Size is 0 , all bits in Out change to FALSE.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Size is outside of the valid range.
- The value of Pos is outside of the valid range.
- The value of Size exceeds the array area of In[].
- In[] is not an array of bit strings.
- An array without a subscript is passed to $\operatorname{In}[]$.

## LineToColm

The LineToColm instruction takes the bits from a bit string and outputs them to the specified bit position in array elements．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| LineToColm | Line to Column Conversion | FUN |  | LineToColm（In，InOut，Size， Pos）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Data to convert | Input | Data to convert | Depends on data type． | －－－ | ＊ |
| Size | Number of elements in result |  | Number of elements in result | 0 to No．of bits in In |  | 1 |
| Pos | Conver－ sion bit position |  | Bit position to receive the conversion | 0 to No．of bits in InOut［］－1 |  | 0 |
| InOut［］ （array） | Conver－ sion result array | In－out | Conversion result | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ⿴囗十 <br> 0 <br> ㅇ |  | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 0 $\sum_{0}$ 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{\substack{C}}{C}$ | $\sum_{i}^{\text {든 }}$ | $\frac{C}{\bar{Z}}$ | $\underset{-1}{\infty}$ | $\bar{\Sigma}_{1}$ | ${\underset{Z}{2}}_{0}^{\infty}$ | $\sum_{-1}^{\Gamma}$ | $$ | $$ | $\stackrel{-1}{\overline{3}}$ |  | 움 | 머 | 号 |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Pos |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut［］ （array） |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The LineToColm instruction takes the bits from a bit string and outputs them to the specified bit position in array elements．

First, Size bits are extracted from the least-significant bit of data to convert In. These bits are treated individually. Then, the bits are stored in conversion result array InOut[] in the Pos bit of the elements starting from InOut[0]. Size specifies the number of array elements to receive bits. The values of all bits for which values are not stored are retained.
The following example is for when Pos is USINT\#3 and Size is USINT\#4.

LD

ST
LineToColm(abc, def[1], USINT\#4, USINT\#3);

## Additional Information

Use the ColmToLine_** instruction (page 2-377) to extract bit values from the specified position of array elements and output them as a bit string.

## Precautions for Correct Use

- If the value of Size is 0 , the values in InOut[] do not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut[] will not change.
- The value of Size is outside of the valid range.
- The value of Pos is outside of the valid range.
- The value of Size exceeds the array area of InOut[].
- InOut[] is not an array of bit strings.
- An array without a subscript is passed to InOut[].

## Gray

The Gray instruction converts a gray code into an angle．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Gray | Gray Code Conver－ sion | FUN |  | Out：＝Gray（In，Resolution， ERC，ZPC）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Data to convert | Input | Gray code to convert | Depends on data type． | －－－ | 0 |
| Resolution | Resolution |  | Resolution | ＿R256，＿R1B to ＿R15B，＿R360，＿R720， or＿R1024 |  | ＿R256 |
| ERC | Encoder remainder correction |  | Encoder remainder correction | 0 to Resolution |  | 0 |
| ZPC | Zero point correction |  | Zero point correction |  |  |  |
| Out | Conver－ sion result | Output | Conversion result | ＊ | － | －－－ |

|  | $$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 罟 | $\begin{aligned} & \text { ロ } \\ & \underset{\sim}{1} \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 $\sum_{0}^{0}$ D | $\Gamma$ 0 0 0 | $\underset{\underset{Z}{6}}{\substack{C}}$ | $\underset{\substack{C}}{C}$ |  | $\frac{\underset{i}{c}}{\underset{1}{2}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 즉 }}{ }$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 置 } \end{aligned}$ | $\frac{-1}{\overline{3}}$ | 号 | 금 | 막 | O |
| In |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Resolution | Refer to Function for the enumerators of the enumerated type＿eGRY＿RESOLUTION． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ERC |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ZPC |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |

## Function

The Gray instruction converts the gray code in In to an integer，compensates（decreases）it by encoder remainder correction $E R C$ and zero point correction $Z P C$ ．It then converts the result to an angle accord－ ing to resolution Resolution．The conversion result Out will be an angle in degrees．

The data type of Resolution is enumerated type _eGRY_RESOLUTION. The meaning of the enumerators are as follows:

| Enumerator | Meaning |
| :--- | :--- |
| _R256 | 256 |
| _R1B | 1-bit (2) |
| _R2B | 2-bit (4) |
| _R3B | 3-bit (8) |
| _R4B | 4-bit (16) |
| _R5B | 5-bit (32) |
| _R6B | 6-bit (64) |
| _R7B | 7-bit (128) |
| _R8B | 8-bit (256) |
| _R9B | 9 -bit (512) |
| _R10B | 10-bit (1024) |
| _R11B | 11-bit (2048) |
| _R12B | 12-bit (4096) |
| _R13B | 13-bit (8192) |
| _R14B | 14-bit (16384) |
| _R15B | 15-bit (32768) |
| _R360 | 360 |
| _R720 | 720 |
| _R1024 | 1024 |

The following example is for when In is WORD\#16\#1A9, Resolution is _R10B, ERC is UINT\#0, and ZPC is UINT\#337. The value of Out will be LREAL\#348.75.

Gray code is converted to binary.
16\#01A9 $\rightarrow$ 16\#0131(10\#305)
Correction (Subtract ERC and ZPC.)
$305-0-337 \rightarrow-32$
Converted to an angle
$-32 \times 360 \div 2^{10} \rightarrow-11.25$
$360-11.25 \rightarrow 348.75$

Out $=\mathrm{abc}$ LREAL\#348.75

## Additional Information

Refer to the user documentation for your rotary encoder for the values to specify for Resolution and ERC.

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- The value of Resolution is outside of the valid range.
- The value of $E R C$ exceeds the resolution that is specified in Resolution.
- The value of ZPC exceeds the resolution that is specified in Resolution.
- In, when converted to a bit string, is smaller than the value of $E R C$.
- The value of the bit string after correction for ERC exceeds the resolution that is specified in Resolution.

## PWLApprox

The PWLApprox instruction performs broken line approximations for integer or real number data.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| PWLApprox | Broken Line Approximation | FUN |  | Out:=PWLApprox(In, Line, Num); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |

| In |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Line[] (array) | Must be an array with elements that have the same data type as In. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |

## Function

The PWLApprox instruction performs approximation for data to convert In. The approximation is based on broken line data that consists of Num times 2 elements that start with Line[0][0] in broken line data array Line[].

Line[] must be a two-dimensional or three-dimensional array. Set the number of elements for the first dimension to 2 . Set the number of elements for the second dimension to 2 . Set the array elements from Line $[0,0]$ to $X_{1}, Y_{1}, X_{2}, Y_{2}$, etc., as shown in the following figure.

The instruction will find the Ya that corresponds to Xa on the broken line graph.

Always attach the element numbers to the input parameter that is passed to Line[], e.g., array[3,4].

The following example is for when Num is UINT\#3, In is INT\#3, $\left(X_{1}, Y_{1}\right)$ is $(1,5),\left(X_{2}, Y_{2}\right)$ is $(2,6)$, and $\left(X_{3}, Y_{3}\right)$ is $(4,2)$.
LD
ST

def:=PWLApprox(INT\#3, abc[3,4], UINT\#3);

In UINT\#3 $\longrightarrow$ Out $=\operatorname{def} \quad 4$

## Precautions for Correct Use

- If the value of $I n$ is smaller than the value of $\operatorname{Line}[0,0]$ (i.e., the value of $X_{1}$ ), then the value of Out will be the value of Line[0,1] (i.e., the value of $Y_{1}$ ).
- If the value of $I n$ is larger than the value of Line[Num-1,0] (i.e., the value of $X_{N u m}$ ), then the value of Out will be the value of Line[Num-1,1] (i.e., the value of $\mathrm{Y}_{\text {Num }}$ ).
- Line[] must be a two-dimensional or three-dimensional array. Set the number of elements for the first dimension to 2.
- If the value of Num is 0 , the value of Out is 0 .
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Num exceeds the array area of Line[].
- The broken line data does not meet this requirement: $X_{1}<X_{2}<\ldots<X_{\text {Num }}$.
- In and Line[] are REAL data and their values are nonnumeric data or infinity.

## MovingAverage

The MovingAverage instruction calculates a moving average．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MovingAverage | Moving Average | FUN |  | Out：＝MovingAverage（In， CurIndex，Buf，BufSize，Q）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Input value | Input | Number to include in aver－ age | Depends on data type． | －－－ | ＊ |
| BufSize | Maximum number stored |  | Maximum number of ele－ ments to include in average |  |  | 1 |
| Curlndex | Input value storage position | In－out | Position in Buf［］in which to store In | Depends on data type． | －－－ | －－－ |
| Buf［］ （array） | Input value storage array |  | Array to store In values |  |  |  |
| Q | Calculation completed flag |  | TRUE：BufSize elements or more have been stored in Buf［］ <br> FALSE：BufSize elements are not yet stored in Buf［］ |  |  |  |
| Out | Calculation result | Output | Calculation result | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |

## Function

The MovingAverage instruction stores the value of input value In in input value storage array Buf[] each time it is executed. It stores the average of the stored values in calculation result Out. Specify the maximum number of elements to include in the average with BufSize.
The processing procedure when BufSize is UINT\#3 is described below as an example. The instruction and statement are written as follows:

LD

ST
jkl:=MovingAverage(abc, def, ghi[1], UINT\#3, mno);

## First Time a Number Is Input

The input value storage position Curlndex is set to 0 and the instruction is executed.
Buf[0] to Buf[BufSize-1] of input value storage array Buf[] are cleared to zeros and the first input value In is stored in Buf[0].
The value of calculation completed flag $Q$ changes to FALSE. This indicates that the number of values that are stored in Buf[] has not reached BufSize yet.
While the value of $Q$ is FALSE, the average value is calculated for the CurIndex +1 numbers that start from Buf[0]. The calculation result is stored in Out.
Finally, the value of CurIndex is incremented.
First Execution of Instruction

$\mathrm{Q}=\mathrm{mno}$ FALSE
FALSE because the number of numbers stored has not reached BufSize.

## Inputting Numbers Up to BufSize

Each time the instruction is executed, the value of $I n$ is stored in Buf[CurIndex]. The average of Curlndex +1 numbers that start from Buf[0] is calculated and stored in Out. When the number of instruction executions reaches BufSize, the value of $Q$ changes to TRUE.

Second Execution of Instruction

Third Execution of Instruction

## Inputting Numbers after Reaching BufSize

Each time the instruction is executed, Buf[0] to Buf[BufSize-1] are overwritten with the value of In in cyclic fashion. The average of Buf[0] to Buf[BufSize-1] is calculated and stored in Out.
The value of Curlndex returns to 1 after it reaches BufSize and it is then incremented again. The value of $Q$ remains TRUE.

Fourth Execution of Instruction

|  | Buf[0]=ghi[1] | 4567 | Buf[0] is overwritten with the value of $I n$. |
| :---: | :---: | :---: | :---: |
|  | Buf[1]=ghi[2] | 2345 |  |
|  | Buf[2]=ghi[3] | 3456 |  |
| CurIndex=def 3 |  |  |  |
| In=abc 4567 | Out=jkl | 3456 | Average of Buf[0] to Buf[2] |
|  |  |  |  |
|  | Curlndex=def | 1 | Returns to 1. |
|  | Q=mno | TRUE | TRUE because the number of |

Fifth Execution of Instruction

|  | Buf[0]=ghi[1] | 4567 | Buf[1] is overwritten with the value of $I n$. |
| :---: | :---: | :---: | :---: |
|  | Buf[1]=ghi[2] | 5678 |  |
|  | Buf[2]=ghi[3] | 3456 |  |
| CurIndex=def 1 |  |  |  |
|  | Out=jkl | 4567 | Average of Buf[0] to Buf[2] |
| $\mathrm{In}=\mathrm{abc} 5678$ |  |  |  |
|  | Curlndex=def | 2 | Incremented |
|  | $Q=m n o$ | TRUE | TRUE because the number of numbers stored has reached BufSize. |

## Initializing the Stored Values

If the value of CurIndex is set to 0 before the instruction is executed, the values in Buf[0] to Buf[BufSize1] are set to 0 and the current value of $I n$ is stored again in Buf[0].
The value of Curlndex changes to 1 and the value of $Q$ changes to FALSE.

## Changing the Value of BufSize

If you change the value of BufSize and execute the instruction, operation is performed with the new value of BufSize and the current value of CurIndex.

Status before Instruction Execution BufSize=3

|  |  |
| ---: | ---: |
| Buf[0]=ghi[1] | 4567 |
| Buf[1]=ghi[2] | 2345 |
| Buf[2]=ghi[3] | 3456 |
| Out=jkl |  |
| Cur |  |
| Cur |  |
|  |  |
| Q=mnox |  |
|  |  |

## Precautions for Correct Use

- Use the same data type for In and the elements of Buf[].
- Use a Buf[] array that is at least as large as the value of BufSize.
- Even if the calculation result exceeds the valid range of Out, an error will not occur. The value of Out will be an illegal value.
- If the value of BufSize is 0 , the values of Out and Curlndex change to 0 . The value of $Q$ changes to TRUE.
- If you change the value of BufSize, always set the value of CurIndex to 0 and initialize the stored values.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In and Buf[] are different data types.
- The value of BufSize is outside of the valid range.
- The value of BufSize exceeds the size of the Buf[] array.
- Buf[] is not an integer array.
- An array without a subscript is passed to Buf[].

## Sample Programming

This sample shows how to eliminate the effect of noise and other disturbances in analog input data, e.g., from a sensor. It assigns the average (DataAve) of the last 25 values of the input data (InputData) to the input data (InputDataForOperating) for the next process.
InputData is input every task period as long as the value of the execution condition (Trigger) is TRUE. Until 25 values of InputData are input, there is not enough data to calculate the average, so the most recent value of InputData is assigned to InputDataForOperating.
When the value of Trigger changes to TRUE, the average is cleared and input of InputData is started again from the beginning.

InputData: Measured value for the current task period
Measured value /

Average of last 25 values is assigned to InputDataForOperating.
LD

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| Trigger | BOOL | False | Execution condition |
| InputData | INT | 10 | Input value |
| Buffer | ARRAY[0..24] OF INT | $[25(0)]$ | Input value storage array |
| DataAve | INT | 0 | Average value |
| OneRound | BOOL | False | Flag that indicates 25 inputs |
| IndexNo | UINT | 0 | Input value storage position |
| InputDataForOperating | INT | 0 | Input to next operation |

When Trigger changes to TRUE, 0 is assigned to IndexNo.
While Trigger is TRUE, the value of InputData is input every task period and the average is calculated.

When there are 25 or more input values for InputData, DataAve is assigned to InputDataForOperating.

Until there are 25 or more input values for InputData, InputData is assigned to InputDataForOperating.

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| Trigger | BOOL | False | Execution condition |
| LastTrigger | BOOL | False | Value of Trigger from previous task period |
| Operating | BOOL | False | Processing |
| OperatingStart | BOOL | False | Processing started |
| Buffer | ARRAY[0..24] OF INT | $[25(0)]$ | Input value storage array |
| InputData | INT | 10 | Input value |
| DataAve | INT | 0 | Average value |
| OneRound | BOOL | False | Flag that indicates 25 inputs |
| IndexNo | UINT | 0 | Input value storage position |
| InputDataForOperating | INT | 0 | Input to next operation |

// Detect when Trigger changes to TRUE.
IF ( (Trigger=TRUE) AND (LastTrigger=FALSE) ) THEN
OperatingStart:=TRUE;
Operating:=TRUE;
END_IF;
LastTrigger:=Trigger;
// Clear the average.
IF (OperatingStart=TRUE) THEN
IndexNo:=UINT\#0;
OperatingStart:=FALSE;
END_IF;
// Calculate the moving average.
IF (Operating=TRUE) THEN
DataAve:=MovingAverage(
In $\quad:=$ InputData,
CurIndex:=IndexNo,
Buf :=Buffer[0],
BufSize :=UINT\#25,
Q :=OneRound);
IF (OneRound=TRUE) THEN
// Assign the average of last 25 values to InputDataForOperating. InputDataForOperating:=DataAve;
ELSE
// Assign the most recent value to InputDataForOperating. InputDataForOperating:=InputData;
END_IF;
END_IF;
// End average processing.
IF (Trigger=FALSE) THEN
Operating:=FALSE;
END_IF;

## PIDAT

The PIDAT instruction performs PID control with autotuning (2-PID control with set point filter).

## Function

The PIDAT instruction performs PID control of a manipulated variable for a temperature controller or other device．PID control is started when the value of execution condition Run changes to TRUE．While the value of Run is TRUE，the following process is repeated periodically：process value $P V$ is read，PID processing is performed，and manipulated variable $M V$ is output．PID control is stopped when the value of Run changes to FALSE．
Autotuning is supported to automatically find the optimum PID constants．When the value of the auto－ tuning execution condition StartAT changes to TRUE，the PID constants are autotuned．

## Structure Specifications

The data type of operation setting parameter OprSetParams is structure _sOPR_SET_PARAMS. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OprSetParams | Operation Setting Parameters | Parameters that are set during operation. | $\begin{aligned} & \hline \text { _sOPR_SET_- } \\ & \text { PARAMS } \end{aligned}$ | --- | --- | --- |
| MVLowLmt | MV Lower Limit | The lower limit of the MV. | REAL | -320 to 320* | \% | 0 |
| MVUpLmt | MV Upper Limit | The upper limit of the MV. | REAL |  |  | 100 |
| ManResetVal | Manual Reset Value | The value of $M V$ when the deviation is 0 for the proportional action. | REAL | -320 to 320 |  | 0 |
| MVTrackSw | MV Tracking Switch | TRUE: ON FALSE: OFF | BOOL | Depends on data type. | --- | FALSE |
| MVTrackVal | MV Tracking Value | The value that is set in MV during MV tracking. | REAL | -320 to 320 | \% | 0 |
| StopMV | Stop MV | The value that is set in $M V$ when instruction execution is stopped. | REAL |  |  |  |
| ErrorMV | Error MV | The value that is set in $M V$ when an error occurs. | REAL |  |  |  |
| Alpha | 2-PID Parameter $\alpha$ | The set point filter is disabled if the set point filter coefficient $\alpha$ is 0 . | REAL | 0.00 to 1.00 | --- | 0.65 |
| ATCalcGain | Autotuning Calculation Gain | Adjustment coefficient from autotuning results. Stability is given higher priority with higher values. The speed of response is given higher priority with lower values. | REAL | 0.1 to 10.0 |  | 1.0 |
| ATHystrs | Autotuning Hysteresis | The hysteresis of the limit cycle. | REAL |  | \% FS | 0.2 |

* MVLowLmt must be less than MVUpLmt.

The data type of initial setting parameter InitSetParams is structure _sINIT_SET_PARAMS. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| InitSetParams | Initial Setting Parameters | Initial setting parameters. | _sINIT_SET_ PARAMS | --- | --- | --- |
| SampTime | Sampling Period | The period for PID processing. | TIME | $\begin{aligned} & \hline \mathrm{T} \# 0.0001 \mathrm{~s} \text { to } \\ & \# 100.0000 \mathrm{~s} \end{aligned}$ | s | T\#0.1s |
| RngLowLmt | Lower Limit of Input Range | The lower limit of $P V$ and $S P$. | REAL | $\begin{aligned} & -32000 \text { to } \\ & 32000^{*} \end{aligned}$ | --- | 0 |
| RngUpLmt | Upper Limit of Input Range | The upper limit of $P V$ and $S P$. | REAL |  |  | 100 |
| DirOpr | Action Direction | TRUE: Forward action FALSE: Reverse action | BOOL | Depends on data type. |  | FALSE |

[^8]
## Meanings of Variables

The meanings of the variables that are used in this command are described below.

## - Run (Execution Condition)

This is the execution condition for the instruction. PID control is performed while the value is TRUE. PID control is stopped when the value changes to FALSE.

## - ManCtl (Manual/Auto Control)

This instruction can be executed in one of two modes: Manual operation or automatic operation. The value of ManCtl determines which mode is used.

| Value of ManCtI | Operation mode | Value of $\boldsymbol{M V}$ |
| :--- | :--- | :--- |
| TRUE | Manual | Value of ManMV (PID control is not performed.) |
| FALSE | Automatic | Value that is calculated for PID control |

## - StartAT (Autotuning Execution Condition)

This is the execution condition for autotuning the PID constants. If the value of StartAT is TRUE when the value of Run changes to TRUE, autotuning is performed when PID control is started. If the value of StartAT changes to TRUE during PID control (i.e., when the value of Run is TRUE), autotuning is performed during PID control. In either case, autotuning is canceled if the value of StartAT changes to FALSE during autotuning. Autotuning is described in more detail later.

## - PV (Process Value)

This is the process value of the controlled system.

## - SP (Set Point)

This is the set point for the controlled system.

## - MVLowLmt (MV Lower Limit) and MVUpLmt (MV Upper Limit)

You can limit the value of MV. MVLowLmt and MVUpLmt are the lower and upper limits to MV. MVLowLmt must always be less than MVUpLmt.

| MV from PID processing | Value of $\boldsymbol{M V}$ |
| :--- | :--- |
| Less than MVLowLmt | MvLowLmt |
| Between MVLowLmt and MVUpLmt, inclusive | MV from PID processing |
| Greater than $M V U p L m t$ | MvUpLmt |

If stop MV StopMV, error MV ErrorMV, or manual MV ManMV is set in manipulated variable MV, limit control is not applied.

## - ManResetVal (Manual Reset Value)

This is the value of $M V$ when the deviation (i.e., the difference between $P V$ and $S P$ ) is 0 for the proportional action. The value of ManResetVal determines the location of the proportional action band.

## - MVTrackSw (MV Tracking Switch)

MV tracking is a function that sets the $M V$ to an external input value (called the MV tracking value) during automatic operation. MV tracking is performed while the value of MVTrackSw is TRUE. When the value of MVTrackSw changes to FALSE, the value of MV returns to the result of PID processing. The value of MV is changed smoothly at this time (bumpless).

- MVTrackVal (MV Tracking Value)

This is the value to which $M V$ is set during MV tracking. The value of MVTrackVal does not have to be between MVLowLmt and MVUpLmt.

## - StopMV (Stop MV)

This is the value to which $M V$ is set when the value of Run is FALSE (i.e., when execution of this instruction is stopped).

## - ErrorMV (Error MV)

This is the value to which $M V$ is set when an error occurs (i.e., when the value of Err is TRUE). If the value of ErrorMV is not within the valid range ( -320 to 320 ), the value of $M V$ will be 0 when an error occurs.

## - Alpha (2-PID Parameter $\alpha$ )

This parameter determines the coefficient of the set point filter. Refer to the description in 2-PID Control with Set Point Filter for details. Normally set the value of Alpha to 0.65.

## - AtCalcGain (Autotuning Calculation Gain)

This variable gives the coefficient of the PID constants that were calculated by autotuning when they are applied to the actual PID constants. If a value of 1.00 is specified, the results of autotuning are used directly. Increase the value of ATCalcGain to give priority to stability and decrease it to give priority to response.

## - ATHystrs (Autotuning Hysteresis)

This is the hysteresis that is used in the limit cycle for autotuning. More accurate tuning is achieved if the value of ATHystrs is small. However, if the process value is not stable and proper autotuning is difficult, increase the value. Refer to the description of autotuning for details.

## - SampTime (Sampling Period)

This is the minimum value of the period for PID processing. Refer to the description of the execution timing of PID processing for details. PID processing is not performed again until the time specified for SampTime has elapsed since the last time PID processing was performed.

## - RngLowLmt (Lower Limit of Input Range) and RngUpLmt (Upper Limit of Input Range)

These are the lower limit and upper limit of $P V$ and $S P$. An error will occur if the value of the parameter connected to $P V$ or $S P$ exceeds either of these limits. RngLowLmt must always be less than RngUpLmt.

## - DirOpr (Action Direction)

This variable specifies if $M V$ is increased or decreased for changes in the value of $P V$. These are called a forward action and a reverse action.

| Value of DirOpr | Meaning | Value of $\boldsymbol{M} \boldsymbol{V}$ |
| :--- | :--- | :--- |
| TRUE | Forward action | Increases with the value of $P V$. |
| FALSE | Reverse action | Decrease with the value of $P V$. |

The difference between a forward action and reverse action are described here for temperature control. A forward action is used to control the MV for a cooler. That is, the higher the process temperature, the larger the MV of the cooler must be. On the other hand, a reverse action is used to control the MV for a heater. That is, the lower the process temperature, the larger the MV of the heater must be.

MVUpLmt Forward Action (DirOpr= TRUE)

## - ProportionalBand (Proportional Band)

This is one of the three PID constants. Refer to the description of the proportional action for details. The larger the ProportionalBand is, the greater the offset is. Hunting occurs if the ProportionalBand is too small.

## - IntegrationTime (Integration Time)

This is one of the three PID constants. Refer to the description of the integral action for details. The larger the value of IntegrationTime is, the weaker the integral action is.

## - DerivativeTime (Derivative Time)

This is one of the three PID constants. Refer to the description of the derivative action for details. The larger the value of DerivativeTime is, the stronger the derivative action is.

## - ManMV (Manual Manipulated Variable)

$M V$ is set to this value during manual operation (while ManCtl is TRUE). However, immediately after changing from automatic to manual operation, the value of MV from automatic operation is used. MV is set to the value of ManMV only when it changes after operation switches to manual operation. When operation changes from manual to automatic operation, the value of MV from manual operation is used. The value of ManMV does not have to be between MVLowLmt and MVUpLmt.

## - ATDone (Autotuning Normal Completion)

This flag indicates when autotuning was completed normally. It changes to TRUE when autotuning is completed normally and remains TRUE as long as the value of StartAT is TRUE. It is FALSE in the following cases.

- An autotuning error end occurred.
- Autotuning is in progress (i.e., while the value of ATBusy is TRUE).
- PID control is in progress without autotuning.
- PID control is not in progress (i.e., the value of Run is FALSE).
- The value of StartAT is FALSE.

## - ATBusy (Autotuning Busy)

This flag indicates when autotuning is in progress. It is TRUE while autotuning is in progress. Otherwise it is FALSE.

## - MV (Manipulated Variable)

This is the manipulated variable that is applied to the controlled system.

## Introduction to PID Control

PID control is a feedback control method that repeatedly measures the process value of the controlled system and calculates a manipulated variable so that the process value approaches a set point. This instruction therefore outputs a manipulated variable for the following inputs: process value, set point, and calculation parameters. PID control periodically measures the process value, calculates the manipulated variable, and outputs the manipulated variable so that the process value approaches the set point.

## Proportional (P), Integral (I), and Derivative (D) Actions

PID control is performed by combining the proportional action, integral action, and derivative action. These actions are described next.

## - Proportional Action (P)

The proportional action increases the absolute value of the manipulated variable in proportion to the deviation between the process value and the set point. The process value of the controlled system changes as shown below.

The proportional band is one of the settings that are used for the proportional action. The proportional band is the range of the process value to which the proportional action is applied. If the process value is not in the proportional band, the manipulated variable is set to $100 \%$ or $0 \%$.
The proportional band is expressed as the percentage of the input range in which to perform the proportional action (\% FS). The following diagram shows the proportional band set to $10 \%$ FS.

Another parameter for the proportional action is the manual reset value. The manual reset value is the manipulated variable that is used when the deviation is 0 . The manual reset value determines the position of the proportional action range in the process value-manipulated variable graph. The relationship between the manual reset value and the proportional action region is shown below.
The position of the proportional action range is determined so that the manipulated variable when the process value and the set point are the same equals the manual reset value.

If the manual reset value is not suitable, the deviation will never reach 0 . The remaining deviation is called the offset or the residual deviation. You can make the proportional band narrower to reduce the offset. If the proportional band is too narrow, the process value will not stop at the set point. This is called overshooting. If the process value does not stabilize and oscillates around the set point, it is called hunting.

## - Integral Action (I)

Very accurate adjustment of the proportional band and manual reset value is required to bring the offset to 0 with only the proportional action. Also, the size of the offset varies with the disturbance, so it is necessary to repeat the adjustment frequently. To simplify the operation, an integral action is used in combination with the proportional action. The integral action integrates the deviation on the time axis and then increases the absolute value of the manipulated variable in proportion to the result. When normal distribution operation is performed, the manual reset value is ignored. The following graph on the left shows changes in the manipulated variable for the integral action when a deviation occurs in stepwise fashion. The following graph on the right shows changes in the manipulated variable when the integral and proportional actions are combined.

One of the parameters for the integral action is the integration time. This is the time for the manipulated variable from the integral action to equal the manipulated variable from the proportional action when a stepwise deviation occurs. The shorter the integration time is, the stronger the integral action is. A short integration time reduces the time for the offset to reach 0 , but it can also cause hunting.

## - Derivative Action (D)

If the proportional and integral actions are used together, the offset will reach 0 and the process value will reach the set point. However, if disturbance causes the process value to change quickly, time is required to restore the original state. The derivative action functions to quickly return the process value to the set point when there is a disturbance. The derivative action differentiates the deviation on the time axis and then increases the absolute value of the manipulated variable in proportion to the result. In other words, the larger the change in the process value is, the larger the absolute value of the manipulated variable for the derivative action is. The changes in the manipulated variable for the derivative action when a deviation occurs in stepwise fashion are shown below. The changes in the manipulated variable when the derivative and proportional actions are combined are also shown.

Manipulated Variable for Derivative Action
Manipulated Variable for Derivative and
Proportional Actions Together

One of the parameters for the derivative action is the derivative time. This is the time for the manipulated variable from the derivative action to equal the manipulated variable from the proportional action when a ramp deviation occurs. The longer the derivative time is, the stronger the derivative action is. A long derivative time provides a rapid response to disturbances, but it can also cause hunting.

The total of the manipulated variables for the proportional, integral, and derivative actions is the manipulated variable for PID control. The changes in the manipulated variable for PID control for a stepwise and ramp deviations are shown below.

## 2-PID Control with Set Point Filter

There are three main parameters that you must adjust to perform PID control: the proportional band, integration time, and derivative time. These are called the PID constants. The values of the PID constants affect the following two performances of PID control.

- Set point response: The ability to follow changes in the set point.
- Disturbance response: The ability of correcting the process value for large changes that are caused by disturbances
A block diagram for basic PID control is shown below. The set point and disturbance enter the block diagram at different positions. Therefore, finding the optimum PID constants for both set point response performance and disturbance response performance is difficult. In other words, if the PID constants are set for set point response, response to disturbances is slow. If the PID constants are set for disturbance response, overshooting occurs.

To enable both set point response and disturbance response, 2-PID control is used. The 2 in " 2 -PID" indicates that there are separate parameters to adjust the set point response and the disturbance response. A block diagram for this is shown below. A set point filter that includes an adjustment parameter is added. The PID constants are adjusted to maximize disturbance response. A set point filter adjusts the set point to optimize the set value response for those values. You can adjust the values of the PID constants and the set value of the set point filter independently to increase both the set point response and the disturbance response.

The formulas of the blocks of this instruction are shown below. The set point filter value (i.e., a coefficient for the set point) is adjusted by using the integration time and the 2-PID parameter $\alpha$. The optimum value of $\alpha$ is 0.65 . It normally does not need to be changed. The lower the value of $\alpha$ is, the smaller the influence of the set point filter is.

## Starting PID Control

You must use suitable PID constants to execute this instruction. There are the following two ways to achieve this.

## - When Suitable PID Constants Are Not Known

Perform autotuning at the start of operation to find suitable PID constants. Change the value of Run to TRUE while the value of StartAT is TRUE. First, autotuning is executed, and then PID control is started with the PID constants that are found.

## - When Suitable PID Constants Are Known

Set suitable PID constants in ProportinalBand, IntegrationTime, and DerivativeTime, and then change Run to TRUE. ProportinalBand, IntegrationTime, and DerivativeTime are in-out variables. You cannot set constants for the input parameters. Always define suitable variables, and then assign the values to input parameters.
You can change the PID constants during operation. You can also perform autotuning during operation. To start autotuning during operation, change the value of StartAT to TRUE.

## Control Status and Manipulated Variable

Manipulated variable $M V$ is determined according to the control status as shown in the following table.

| Control status | Value of variable |  |  |  |  | Manipulated variable MV |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ManCtI (manual/auto control) | Run (execution condition) | Error (error end) | ManTrackSw (manual tracking switch) | ATBusy (autotuning busy) |  |
| Error end | FALSE | TRUE | TRUE | --- | FALSE | ErrorMV (error MV) |
| MV tracking during automatic operation |  |  | FALSE | TRUE |  | MVTrackVal (MV tracking value) |
| Autotuning during automatic operation |  |  |  | FALSE | TRUE | Value repeatedly changes between upper limit of MV and lower limit of MV. |
| Not autotuning during automatic operation |  |  |  |  | FALSE | Value calculated with current PID constants. |
| Instruction execution stopped |  | FALSE | --- | --- |  | StopMV (Stop MV) |
| Manual operation | TRUE | --- |  |  |  | ManMV (manual manipulated variable) |

## Autotuning

The 2-PID parameter $\alpha$ is not adjusted very often, so the main parameters that are adjusted for this instruction are the PID constants. The PIDAT instruction supports autotuning of the PID constants. The limit cycle method is used for autotuning. With the limit cycle method, the manipulated variable is temporarily changed to the upper and lower limits of the manipulated variable to find the optimum PID constants based on the resulting changes in the process value. If autotuning is executed when the set point is greater than the process value, the manipulated variable is first set to the upper limit. When the deviation reaches 0 , the manipulated variable is set to the lower limit. When the deviation becomes greater than the autotuning hysteresis, the manipulated variable is set to the upper limit again. This process is repeated twice to calculate the optimum PID constants.
If autotuning is executed when the set point is less than the process value, the manipulated variable is first set to the lower limit. Then, the optimum values for the PID constants are calculated with the procedure that is given above.

Autotuning is executed during PID control (i.e., when the value of Run is TRUE) if the value of StartAT changes to TRUE. If StartAT is TRUE when Run changes to TRUE, autotuning is executed at the start of PID control. When autotuning is completed normally, the calculated PID constants are used immediately. Autotuning is canceled if the value of StartAT changes to FALSE during autotuning (i.e., when ATBusy is TRUE). If autotuning is canceled, PID control is started again with the previous PID constants.

## Execution Timing of PID Control

PID control is repeated periodically. PID processing is performed when the PIDAT instruction is executed in the user program. However, if sampling period SampTime has not elapsed since the last time PID processing was performed, PID processing is nor performed. If the elapsed time since the last time PID processing was executed exceeds SampTime, the excess time (elapsed time - SampTime) is carried forward to the next period. This is shown in the following diagram.

Task period $=60 \mathrm{~ms}$ and SampTime $<60 \mathrm{~ms}$
The task period is greater than or equal to SampTime, so PID processing is executed once every task period.
$\mid \longleftarrow$ Task period $\longrightarrow \mid \longleftarrow$ Task period $\longrightarrow \mid \longleftarrow$ Task period $\longrightarrow \mid \longleftarrow$ Task period $\longrightarrow \mid \longleftarrow$ Task period $\longrightarrow \mid$

Time $\longrightarrow$
Task period $=60 \mathrm{~ms}$ and SampTime $=100 \mathrm{~ms}$
The task period is less than SampTime, so DIP processing is not executed every period.

## Timing Charts

Timing charts for the instruction variables are provided below for different situations.

- Autotuning Executed during Automatic Operation

- Autotuning Executed at the Start of PIDAT Execution

- Autotuning Canceled

## - An Autotuning Error Occurs during Autotuning

An autotuning error occurs and autotuning is stopped in the following cases.

- If the MV equals the MV upper limit and the time for the deviation to reach 0 exceeds $19,999 \mathrm{~s}$.
- If the MV equals the MV lower limit and the time for the deviation to reach AtHystrs or higher exceeds 19,999 s.
If autotuning is canceled, PID control is started again with the previous PID constants.

The PID constants from before
autotuning was started are set.

## Additional Information

## Adjusting PID Constants

- If you need to eliminate hunting even if it takes time to stabilize the control system, increase the value of ProportionalBand. If a certain amount of hunting is not a problem, but it is necessary for the controlled system to stabilize quickly, decrease the value of ProportionalBand.

- If hunting continues too long, increase ProportionalBand or increase IntegrationTime.

- If rapid hunting occurs, decrease DerivativeTime.

## Initial PID Constants for Temperature Control

If you use the PIDAT instruction for temperature control, use the following initial values of the PID constants as reference. Use the default values for the other variables.

| Variables | Initial values (reference values) ${ }^{\boldsymbol{*}}$ |
| :--- | :--- |
| ProportinalBand | $10 \% \mathrm{FS}$ |
| IntegrationTime | 233 s |
| DerivativeTime | 40 s |

* If you perform autotuning, use the results from autotuning.

## Precautions for Correct Use

- The values of PV and SP must be between the values of RngLowLmt and RngUpLmt, inclusive. Align the units of these variables as shown below.

| Unit | Values of $P V$ and SP | Values of RngLowLmt and <br> RngUpLmt |
| :--- | :--- | :--- |
| $\%$ FS | $\mathrm{PV}=($ Process value in physical units -MIN$) /(\mathrm{MAX}-\mathrm{MIN}) \times 100$ | RngLowLmt $=0$ |
|  | $\mathrm{SP}=($ Set point in physical units -MIN$) /(\mathrm{MAX}-\mathrm{MIN}) \times 100^{\star}$ | RngUpLmt $=100$ |
| Physi- <br> cal unit | $\mathrm{PV}=$ Process value in physical units <br> $\mathrm{SV}=$ Set point in physical units | RngLowLmt $=$ MIN |

* MAX: Upper limit of input range in physical units, MIN: Lower limit of input range in physical units,
- The following table shows which variables can be changed depending on the operating status.

| Variables | Control status |  |  |
| :--- | :--- | :--- | :--- |
|  | $\begin{array}{c}\text { Instruction execution } \\ \text { stopped }\end{array}$ | $\begin{array}{c}\text { Automatic operation } \\ \text { when autotuning is not } \\ \text { being executed }\end{array}$ |  | \(\left.$$
\begin{array}{c}\text { 2 }\end{array}
$$ \begin{array}{c}Automatic operation <br>

when autotuning is being <br>
executed\end{array}\right\}\)

| Variables | Control status |  |  |
| :--- | :--- | :--- | :--- |
|  | Instruction execution <br> stopped*1 |  |  |
| MVTrackVal | Possible | Automatic operation <br> when autotuning is not <br> being executed | Automatic operation <br> when autotuning is being <br> executed 3 |
| StopMV | Possible | Possible | Not possible |
| ErrorMV | Possible | Possible | Possible |
| Alpha | Possible | Possible | Possible |
| ATCalcGain | Possible | Possible | Not possible |
| ATHystrs | Possible | Possible | Not possible |
| SampTime | Possible | Not possible | Not possible |
| RngLowLmt | Possible | Not possible | Not possible |
| RngUpLmt | Possible | Not possible | Not possible |
| DirOpr | Possible | Not possible | Not possible |
| ProportinalBand | Possible | Possible | Not possible |
| IntegrationTime | Possible | Possible | Not possible |
| DerivativeTime | Possible | Possible | Not possible |
| ManMV | Possible | Possible | Not possible |

*1 ManCtl is TRUE, Run is FALSE, Error is TRUE, or MVTrackSw is TRUE.
*2 MacCtl is FALSE, Run is TRUE, Error is FALSE, MVTrackSw is FALSE, and ATBusy is FALSE.
*3 MacCtl is FALSE, Run is TRUE, Error is FALSE, MVTrackSw is FALSE, and ATBusy is TRUE.

- SampTime is truncated below 100 nanoseconds.
- If the value of StartAT changes to TRUE while the value of ManCtl is TRUE, autotuning starts the next time the value of ManCt/ changes to FALSE.
- If the value of ErrorMV is not within the valid range ( -320 to 320 ), the value of $M V$ will be 0 when an error occurs.
- Autotuning is canceled if the value of ManCtl changes to TRUE during autotuning.
- The value of Error does not change to TRUE even if an error occurs during autotuning.
- An error occurs in the following case. Error will change to TRUE, and an error code is assigned to ErrorID. ATDone and ATBusy change to FALSE. MV is set to the value of ErrorMV if the values of ManCtl and Run are FALSE. If the value of ErrorMV is outside of the valid range, the value of $M V$ is 0 .

| Error | Value of ErrorID |
| :--- | :--- |
| The value of an input variable is outside of the valid range. | $16 \# 0400$ |
| RngLowLmt is greater than or equal to RngUpLmt. | $16 \# 0401$ |
| MVLowLmt is greater than or equal to MVUpLmt. |  |

- If an error stop is required for conditions other than the above, program the system so that the value of Run changes to FALSE when the error occurs.
- If an error occurs because the value of $P V$ or $S P$ exceeds the valid range, the error status is maintained for five seconds even if the value returns to within the valid range sooner. That is, the value of Error will remain FALSE for five seconds.
- PID control is restarted automatically if the value of Run is TRUE after the error is reset. Autotuning is restarted automatically if the values of Run and StartAT are TRUE.
- A check is made for errors each sampling period.

## Sample Programming

In this sample, the PIDAT instruction is used to perform temperature control.

## Specifications

Temperature control is performed according to the following specifications.

| Item | Specification |
| :--- | :--- |
| Input type | K thermocouple |
| Input Unit | CJ1W-PH41U Analog Input Unit with Universal Inputs |
| Output Unit | CJ1W-OD212 Transistor Output Unit |
| Set point | $90^{\circ} \mathrm{C}$ |
| Sampling period for PID control | 100 ms |
| Output control period | 1 s |

## Configuration and Settings

The following setting is used for the CJ1W-PH41U Analog Input Unit.

| Setting | Set value |
| :--- | :--- |
| Input1:Input signal type | $\mathrm{K}(1)$ |

The following I/O map settings are used.

| Unit | I/O port | Description | Variable |
| :--- | :--- | :--- | :--- |
| CJ1W-PH41U | Ch1_AllnPV | Measurement value for input 1 (INT data) | Al1 |
| CJ1W-OD212 | Ch1_Out00 | Bit 00 of output word 1 | DO1 |

## Processing

- The manipulation value MV of the PIDAT instruction is obtained to control the output to the temperature controller. The output to the temperature controller is turned ON and OFF.
- The sampling period (InitSetParams.SampTime) of the PIDAT instruction is set to 100 ms . The task period must be sufficiently shorter than 100 ms . Therefore, the value of MV is refreshed every 100 ms.
- The output control period is 1 s . During that period, the ON time and OFF time of the output control value are controlled with a time-proportional output. For example, if the obtained value of $M V$ is $20 \%$, the output to the temperature control is ON for 200 ms and OFF for 800 ms . This is repeated at a 1-s period.

- If the most recent value of $M V$ is smaller than the value of $M V$ when the output control values were determined, the output control values do not change. If the most recent value of $M V$ is larger than the value of $M V$ when the output control values were determined, the most recent value is immediately reflected in the output control values. For example, assume that the output control values were determined when the value of $M V$ was $20 \%$ (ON 200 ms , OFF 800 ms ). If after 100 ms , the new value of $M V$ is $30 \%$, the output control values are immediately changed to turn the output ON for 300 ms and OFF for 700 ms .

MV at this point: $30 \%$ The output control values are immediately changed to turn the output ON for 300 ms and OFF for 700 ms .

- If autotuning is performed and the value of MV is $100 \%$, the output is immediately turned ON regardless of the control period.

## Application Programming

| Fraction | Must be DINT if the data type of $\operatorname{In}$ is REAL and LINT if the data type of $I n$ is LREAL． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Exponent |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |

## Function

The DispartReal instruction separates real number In into signed mantissa Fraction and exponent Exponent．
If $I n$ is REAL data，Fraction is a 7－digit integer．If $I n$ is LREAL data，Fraction is a 15－digit integer．

The following example is for when In is REAL data with a value of REAL\#-123.456.

The following example is for when In is LREAL data with a value of LREAL\#-123.456789.

The following table shows the valid ranges for Fraction according to the data types In and Fraction.

| Data type of $\boldsymbol{I n}$ | Data type of Fraction | Valid range of Fraction |
| :--- | :--- | :--- |
| REAL | DINT | -9999999 to 9999999 |
| LREAL | LINT | -999999999999999 to 999999999999999 |

## Additional Information

Use the UniteReal instruction (page 2-421) to combine a signed mantissa and exponent to form a real number.

## Precautions for Correct Use

- Depending on the value of $I n$, error may occur in the conversion to an integer.
- If the number of valid digits in In exceeds the number of valid digits of Fraction, the value is rounded to fit in the valid range of Fraction. The following table shows how values are rounded.

| Value of fractional part | Treatment | Examples |
| :--- | :--- | :--- |
| Less than 0.5 | The fractional part is truncated. | $1.49 \rightarrow 1$ |
|  |  | $-1.49 \rightarrow-1$ |
| 0.5 | If the ones digit is an even number, the value is trun- | $1.50 \rightarrow 2$ |
|  | cated. If it is an odd number, the value is rounded up. | $2.50 \rightarrow 2$ |
|  |  | $-1.50 \rightarrow-2$ |
|  |  | $-2.50 \rightarrow-2$ |
| Greater than 0.5 | The fractional part is rounded up. | $1.51 \rightarrow 2$ |
|  |  | $-1.51 \rightarrow-2$ |

- An error occurs in the following case. ENO will be FALSE, and Fraction and Exponent will not change.
- The value of $I n$ is nonnumeric or infinity.

## UniteReal

The UniteReal instruction combines a signed mantissa and exponent to make a real number．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :--- | :--- |
| UniteReal | Combine Real <br> Number Mantissa <br> and Exponent | FUN | （＠）UniteReal <br> EN <br> Eraction <br> ENO <br> Exponent | Out：＝UniteReal（Fraction， <br> Exponent）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | O <br> O <br> O | $\begin{aligned} & \text { ロ } \\ & \underset{\sim}{1} \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\sum_{-1}^{C N}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{0_{3}^{2}}{1}$ | $\underset{\underset{1}{C}}{\stackrel{C}{n}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\overline{\mathrm{Z}}$ | $\underset{\sim}{2}$ | $\bar{K}_{-1}^{\Gamma}$ | $\begin{aligned} & \mathbb{D} \\ & \text { m } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \text { I } \end{aligned}$ | $\frac{-1}{\overline{1}}$ | $\begin{aligned} & \text { 号 } \\ & \text { 㬅 } \end{aligned}$ | 음 | 막 |  |
| Fraction |  |  |  |  |  |  |  |  |  |  |  | OK | OK |  |  |  |  |  |  |  |
| Exponent |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |
| Out | Must be REAL if the data type of Fraction is DINT and LREAL if the data type of Fraction is LINT． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The UniteReal instruction combines signed mantissa Fraction and exponent Exponent to make real number Out．
The following example is for when Fraction is DINT\＃－15 and Exponent is INT\＃－1．

## Additional Information

Use the DispartReal instruction (page 2-418) to separate a real number into the signed mantissa and exponent.

## Precautions for Correct Use

- Depending on the values of Fraction and Exponent, error may occur in the conversion from an integer to a real number.
- If the combined result exceeds the valid range of Out and Exponent is positive, the value of Out will be infinity with the same sign as Fraction. If Exponent is negative, the value of Out will be 0.

## NumToDecString and NumToHexString

$\begin{array}{ll}\text { NumToDecString：} & \text { Converts an integer to a fixed－length decimal text string．} \\ \text { NumToHexString：} & \text { Converts an integer to a fixed－length hexadecimal text string．}\end{array}$

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| NumToDecString | Fixed－length Decimal Text String Conversion | FUN |  | Out：＝NumToDecString（In， L，Fill）； |
| NumToHexString | Fixed－length Hexadecimal Text String Conversion | FUN |  | ```Out:=NumToHexString(In, L, Fill);``` |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Integer | Input | Integer | Depends on data type． | －－－ | ＊ |
| L | Number of characters |  | Number of characters in Out | 0 to 1985 |  | 1 |
| Fill | Fill character |  | Fill character | ＿BLANK or＿ZERO |  | ＿BLANK |
| Out | Text string | Output | Text string | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  |  | it s | ings |  |  |  |  | Int | ers |  |  |  |  |  |  | mes | $\begin{aligned} & \text { dur } \\ & \text { de } \end{aligned}$ | $\begin{array}{r} \text { ion } \\ \text { str } \end{array}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { O } \\ & \text { O } \\ & \text { 1 } \end{aligned}$ | $\begin{aligned} & \text { 罦 } \end{aligned}$ | $\sum$ O O | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{\substack{-1}}{\bar{E}}$ |  | $\underset{\underset{1}{c}}{\stackrel{C}{c}}$ | $\sum_{-1}^{\infty}$ | $\underset{\sim}{\underline{1}}$ | $\sum_{-1}^{0}$ | $\sum_{\underset{1}{2}}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{\rightharpoonup}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\frac{-1}{1}$ | 号 | －1 | 먹 | 号 |
| In |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |
| L |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Fill | Refer to Function for the enumerators for the enumerated type＿eFILL＿CHR． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

## －NumToDecString

The NumToDecString instruction converts integer In to a decimal text string of UTF－8 alphanumeric characters．If In contains a negative value，a minus sign（ - ）is added to the front of the text string．

## －NumToHexString

The NumToHexString instruction converts integer In to a hexadecimal text string of UTF－8 alphanu－ meric characters．If In is negative，it is expressed in its two＇s complement（bits inverted and then 1 added）．
For either instruction，the number of characters in text string Out is adjusted to number of characters $L$ ． If there are not enough characters，the upper digits are filled with fill character Fill．If the number of char－ acters in the conversion result exceeds $L, L$ characters from the lower digits of the conversion result are assigned to Out．The NULL character is not included in the number of characters．
The data type of Fill is enumerated type＿eFILL＿CHR．The meaning of the enumerators are as follows：

| Enumerator | Meaning |
| :--- | :--- |
| ＿BLANK | ＂（blank character） |
| ＿ZERO | ＇0＇ |

The following examples are for the NumToDecString instruction．

The following examples are for the NumToHexString instruction．

$$
\begin{array}{ll}
\text { LD } & \text { ST }
\end{array}
$$

$$
\begin{aligned}
& \text { In }=\mathrm{abc}=\mathrm{INT} \# 128, \mathrm{~L}=\text { def }=\text { UINT\#8, Fill }=\text { ghi }=\text { _BLANK } \\
& \text { Out = jkl पП】】】810 }
\end{aligned}
$$

$$
\begin{aligned}
& \text { In }=\mathrm{abc}=\text { INT\#128, L }=\text { def }=\text { UINT\#8, Fill }=\text { ghi }=\text { ZERO } \\
& \text { Out }=\text { jkl 010|0|0|0|0|80 }
\end{aligned}
$$

[^9]
## Precautions for Correct Use

- The value of Out does not change if the value of $L$ is 0 .
- If the number of characters in the conversion result exceeds the value of $L, L$ characters from the lower characters of the conversion result are stored in Out. The following is an example.

| Instruction | Value of $\boldsymbol{I n}$ | Value of $\boldsymbol{L}$ | Value of Out |
| :--- | :--- | :--- | :--- |
| NumToDecString | 128 | 2 | 28 |
| NumToHexString |  |  |  |

- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of $L$ is outside of the valid range.
- The value of Fill is outside of the valid range.
- The conversion result exceeds the range of Out.

## HexStringToNum

The HexStringToNum＿＊＊instruction converts a hexadecimal text string to an integer．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| HexStringTo Num＿＊＊ | Hexadecimal Text String－to－Number Conversion Group | FUN | ＂＊＊＂must be an integer data type． | Out：＝HexStringToNum＿＊（In）； ＂＊＊＂must be an integer data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Hexadecimal <br> text string | Input | Hexadecimal text string | Depends on data type． | --- | $"$ |
| Out | Integer | Output | Integer | Depends on data type． | --- | --- |

|  |  |  | s | g |  |  |  |  | Int | gers |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \text { s, a } \end{aligned}$ | dur |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O <br> O <br> O | 品 | ミ | $\begin{aligned} & \text { O} \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{2}}_{\substack{C}}$ | $\underset{\substack{C}}{\substack{c}}$ |  | $\underset{\underset{1}{c}}{\stackrel{C}{c}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\substack{\text { 민 }}}{ }$ | $\sum_{i}^{\Gamma}$ | $$ | $\begin{aligned} & \text { 「 } \\ & \text { 罧 } \end{aligned}$ | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 목 } \\ & \text { n } \end{aligned}$ | 금 | 믹 | 0 $\frac{10}{0}$ 0 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |  |  |

## Function

The HexStringToNum＿＊＊instruction converts hexadecimal text string In to an integer．Any spaces （16\＃20）or＇ 0 ＇（16\＃30）in the upper digits are ignored．Underbars（16\＃5F）in the text string are ignored．
The name of the instruction is determined by the data type of Out．For example，if Out is the INT data type，the instruction is HexStringToNum＿INT．
A few examples are given below．
LD
ST
def：＝HexStringToNum＿INT（abc）；

In $=$ abc－O｜0｜0｜0｜0｜O｜F $\longrightarrow$ Out $=$ def $=-15$

## Precautions for Correct Use

- Even if the conversion result exceeds the valid range of Out, an error will not occur. The value of Out will be an illegal value.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In does not end in a NULL character.
- The content of In includes characters that cannot be converted to numbers.

## FixNumToString

The FixNumToString instruction converts a signed fixed-decimal number to a decimal text string.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| FixNumToString | Fixed-decimal Number-to-Text String Conversion | FUN |  | Out:=FixNumToString(In, Zero); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Fixeddecimal number |  | Signed fixed-decimal number |  |  | 0 |
| Zero | Zero augmentation | Input | Augmentation of zeros if there are less than 3 decimal digits <br> TRUE: Add '0' <br> FALSE: Do not add ' 0 ' | Depends on data type. | -- | TRUE |
| Out | Decimal text string | Output | Hexadecimal text string | Depends on data type. | --- | --- |

## Function

The FixNumToString instruction converts signed fixed-decimal number In to a decimal text string. The following conversion is used.

1 The hexadecimal number $I n$ is converted to a decimal number.
2 The result is divided by 1,000 .
Zero augmentation Zero specifies whether to add ' 0 ' to the third decimal place of Out when there are less than three decimal digits in In. If the value of Zero is TRUE, ' 0 ' is added. A NULL character is placed at the end of Out.

A few examples are given below.

| In = abc | Out $=$ ghi |  |
| :--- | :--- | :--- |
|  | Zero $=$ def $=$ TRUE | Zero $=$ def $=$ FALSE |
| 16\#0001462C <br> $(10 \# 83500)$ | '83.500' | '83.5' |
| 16\#00051AA4 <br> $(10 \# 334500)$ | '334.500' | '334.5' |
| 16\#0003BEFC <br> $(10 \# 245500)$ | '245.500' | '245.5' |

## Additional Information

The format for fixed-point decimal numbers is the same as the fixed-decimal output format of the OMRON FZ-series Vision Sensors.

## Precautions for Correct Use

An error occurs in the following case. ENO will be FALSE, and Out will not change.

- The conversion result exceeds the valid range of Out.

## StringToFixNum

The StringToFixNum instruction converts a decimal text string to a signed fixed-decimal number.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StringToFixNum | Text String-to-Fixed-decimal Conversion | FUN |  | Out:=StringToFixNum(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Decimal text <br> string | Input | Decimal text string | Depends on data type. | --- | $"$ |
| Out | Fixed-decimal <br> number | Output | Fixed-decimal number | Depends on data type. | --- | --- |

## Function

The StringToFixNum instruction converts decimal text string In to a fixed-decimal number. The following conversion is used.

1 The number in $I n$ is multiplied by 1,000 .
2 The fractional part is truncated.
3 The result is given as a 32-bit hexadecimal number (DWORD).
A few examples are given below.

| In = abc | Out $=$ def |
| :--- | :--- |
| '83.5' | $16 \# 0001462 \mathrm{C}$ |
|  | $(10 \# 83500)$ |
| '334.5' | $16 \# 00051 \mathrm{AA4}$ |
|  | $(10 \# 334500)$ |
| $' 245.5 ’$ | $16 \# 0003 \mathrm{BEFC}$ |
|  | $(10 \# 245500)$ |

The format of the text sting in In is given below.

| Name | Format |
| :--- | :--- |
| Sign | - Any consecutive blank characters (16\#20) at the beginning of the text string are ignored. Any sin- <br> gle plus or minus sign that follows is treated as the sign. |
|  | - The sign can be omitted. |
| - Any consecutive blank characters after the sign are ignored. |  |

Example 1: The following example uses the sign, decimal point, and fractional part, but does not use an exponent.

Example 2: The following example uses the sign, decimal point, fractional part, and exponent.

Example 3: The following example does not use the sign, but uses the decimal point, fractional part, and exponent.

Example 4: The following example does not use the sign, fractional part, decimal point, and exponent.

## Additional Information

The format for fixed-point decimal numbers is the same as the fixed-decimal output format of the OMRON FZ-series Vision Sensors.

## Precautions for Correct Use

- The digits after the third decimal digit are truncated in In.
- Underbars (16\#5F) in the text string in In are ignored.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In does not end in a NULL character.
- The content of In includes characters that cannot be converted to numbers.
- The content of $I n$ has a decimal point but not a fractional part.
- The conversion result exceeds the valid range of Out.

## DtToString

The DtToString instruction converts a date and time to a text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DtToString | Date and Time－to－Text String Conversion | FUN |  | Out：＝DtToString（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Date and <br> time | Input | Date and time | Depends on data type． | Year，month， <br> day，hour， <br> minutes， <br> seconds | DT\＃197 <br> $0-1-1-$ <br> $0: 0: 0$ |
| Out | Text string | Output | Text string | 30 bytes（29 single－byte <br> alphanumeric charac－ <br> ters plus the final NULL <br> character） | --- | --- |

|  |  |  | it st | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | mes | dura d tex |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | \％ | $\underset{\text { m }}{\substack{\text { n }}}$ | $\begin{aligned} & \text { § } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { D } \\ & 0 \\ & 0 \\ & 0 \end{aligned}$ | $\begin{aligned} & \hline \sum_{0} \\ & 0 \\ & 0 \end{aligned}$ | $\sum_{-1}^{\infty}$ | $\sum_{\substack{c}}$ | $\underset{\sum_{i}}{\substack{C}}$ | $\underset{\underset{-}{c}}{\substack{c}}$ | $\sum_{-1}^{\infty}$ | $\sum_{1}$ | $\underset{Z}{\underline{Z}}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{N}{2} \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{N}{i} \end{aligned}$ | $\frac{-1}{\overline{3}}$ | $\begin{aligned} & \text { 另 } \\ & \text { 符 } \end{aligned}$ | ò | 닥 |  |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The DtToString instruction converts date and time In to a text string．A NULL character is placed at the end of text string Out．
An example when In is 2010－5－23－07：00：15．873232345（7：00 am and 15．873232345 seconds on May 23,2010 ）is given below．The value of variable abc will be＇2010－05－23－07：00：15．873232345＇．

LD

ST
abc：＝DtToString（DT\＃2010－05－23－07：00：15．873232345）；

## Additional Information

Out is in nanoseconds. To get a text string in seconds or milliseconds, combine this instruction with the LEFT or RIGHT instruction (page 2-522).
An example to get a text string in seconds is given below.

- LD

- ST
def:=LEFT(DtToString(DT\#2000-01-23-01:23:45.678), UINT\#19);

## Precautions for Correct Use

An error occurs in the following case. ENO will be FALSE, and Out will not change.

- The conversion result exceeds the valid range of Out.

## DateToString

The DateToString instruction converts a date to a text string.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :---: | :---: |
| DateToString | Date-to-Text String <br> Conversion | FUN | (@)DateToString <br> EN <br> ENO <br> In |  |
|  |  | Out:=DateToString(In); |  |  |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| In | Date | Input | Date | Depends on data type. | Year, month, <br> day | D\#1970-1-1 |
| Out | Text string | Output | Text string | 11 bytes (10 single-byte <br> alphanumeric characters plus <br> the final NULL character) | --- | --- |

## Function

The DateToString instruction converts date In to a text string. A NULL character is placed at the end of Out.

An example when In is 2010-5-23 (May 23, 2010) is given below. The value of variable abc will be '2010-05-23'.

## Precautions for Correct Use

An error occurs in the following case. ENO will be FALSE, and Out will not change.

- The conversion result exceeds the valid range of Out.

## TodToString

The TodToString instruction converts a time of day to a text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TodToString | Time of Day－to－Text String Conversion | FUN |  | Out：＝TodToString（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| In | Time of day | Input | Time of day | Depends on data type． | Hour， <br> minutes， <br> seconds | TOD\＃0：0：0 |
| Out | Text string | Output | Text string | 19 bytes（18 single－byte alpha－ <br> numeric characters plus the <br> final NULL character） | －－－ | －－－ |

## Function

The TodToString instruction converts time of day In to a text string．A NULL character is placed at the end of Out．An example when In is 07：00：15．873232345（7：00 am and 15.873232345 seconds）is given below．The value of variable abc will be＇07：00：15．873232345＇．

## Additional Information

Out is in nanoseconds．To get a text string in seconds or milliseconds，combine this instruction with the LEFT or RIGHT instruction（page 2－522）．

An example to get a text string in seconds is given below.

- LD

- ST
def:=LEFT(TodToString(TOD\#01:23:45.678), UINT\#8);

## Precautions for Correct Use

An error occurs in the following case. ENO will be FALSE, and Out will not change.

- The conversion result exceeds the valid range of Out.

## GrayToBin_** and BinToGray_**

GrayToBin_**: Converts a gray code to a bit string.
BinToGray_**: Converts a bit string to a gray code.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GrayToBin_** | Gray Code-to- <br> Binary Code <br> Conversion Group | FUN |  | Out:=GrayToBin_**(In); "**" must be a bit string data type. |
| BinToGray_** | Binary Code-toGray Code Conversion | FUN |  | Out:=BinToGray_**(In); must be a bit string data type. |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Data to convert | Depends on data type. | --- | 0 |
| Out | Conver- <br> sion result | Output | Conversion result | Depends on data type. | --- | --- |

## Function

## - GrayToBin_*

The GrayToBin_** instructions convert the gray code in date to convert In to a bit string. The conversion procedure is as follows for when In and Out are BYTE data.
1
The most-significant bit (bit 7) of $I n$ is used as is as the most-significant bit (bit 7 ) of Out.
2 An exclusive logical OR is taken of the value of bit 6 in In and the value of bit 7 in Out. The result is used as bit 6 of Out.

3 This process is repeated through the least-significant bit (bit 0) of Out.

The following example for the GrayToBin_BYTE instruction is for when In is BYTE\#16\#A5.

## - BinToGray_**

The BinToGray_** instructions convert the bit string in data to convert In to a gray code. The conversion procedure is as follows for when In and Out are BYTE data.

1 The most-significant bit (bit 7 ) of $I n$ is used as is as the most-significant bit (bit 7 ) of Out.
2 An exclusive logical OR is taken of the value of bit 7 in $\operatorname{In}$ and the value of bit 6 in $\ln$. The result is used as bit 6 of Out.

3 This process is repeated through the least-significant bit (bit 0) of Out.

The following example for the BinToGray_BYTE instruction is for when In is BYTE\#16\#C6.

The name of the instruction is determined by the data types of In and Out. For example, if In and Out are the WORD data type, the instruction is GrayToBin_WORD or BinToGray_WORD.

## Precautions for Correct Use

The data types of In and Out must be the same.

## StringToAry

The StringToAry instruction converts a text string to a BYTE array．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StringToAry | Text String－to－Array Conversion | FUN |  | Out：＝StringToAry（In，Ary－ Out）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Text string | Input | Text string | Depends on data type． | --- | ＂ |
| AryOut［］ <br> （array） | BYTE array | In－out | BYTE array | Depends on data type． | --- | －－－ |
| Out | Number of <br> bytes to <br> convert | Output | Number of bytes to convert | 0 to 1985 | Bytes | --- |

|  | $\begin{aligned} & \text { © } \\ & \text { o } \\ & \frac{0}{0} \\ & \stackrel{1}{j} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 置 } \\ & \text { } \end{aligned}$ | $\begin{aligned} & \text { 眔 } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{2}}_{\substack{C}}$ | $\underset{\underset{1}{\mathrm{Z}}}{\substack{\text { ( }}}$ | $\frac{\text { 들 }}{\frac{1}{2}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 즉 }}{ }$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \text { 亚 } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \text { I } \end{aligned}$ | $\stackrel{-1}{\overline{1}}$ |  | -1 | 먹 | 0 $\frac{1}{0}$ 2 0 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| AryOut［］ （array） |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The StringToAry instruction takes the character codes in text string In as numbers and stores them indi－ vidually in a BYTE array，AryOut［］．The number of bytes that was converted is stored in Out．

The following example is for when $I n$ is ' $X Y Z$ '.

def:=StringToAry('XYZ', abc[1]);
Out=def UINT\#3

## Precautions for Correct Use

- The NULL character at the end of $I n$ is not stored in AryOut[].
- If the In text string contains only the NULL character, the value of Out will be 0 and AryOut[] will not change.
- An error occurs in the following cases. ENO will be FALSE, and Out and AryOut[] will not change.
- In does not end in a NULL character.
- The number of bytes in $I n$ is larger than the number of elements in AryOut[].

## AryToString

The AryToString instruction converts a BYTE array to a text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryToString | Array－to－Text String Conversion | FUN |  | Out：＝AryToString（In，Size）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln []$（array） | BYTE array | Input | BYTE array Maximum number of elements： 1985 | Depends on data type． | －－ | ＊ |
| Size | Number of elements to convert |  | Number of elements of $\operatorname{In}[]$ for conversion | 0 to 1985 |  | 1 |
| Out | Text string | Output | Text string | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { © } \\ & \frac{0}{0} \\ & \stackrel{0}{J} \end{aligned}$ |  | it s | ings |  |  |  |  | Int | ers |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \end{aligned}$ | dur | str |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 罟 } \\ & \text { 1 } \end{aligned}$ | $\begin{aligned} & \text { 䍐 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { 另 } \end{aligned}$ |  | $\underset{\underset{-1}{C}}{\substack{C}}$ | $\frac{\text { 들 }}{}$ | $\frac{\text { 득 }}{\overline{2}}$ | ${\underset{Z 1}{\infty}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{Z}{2}}_{2}^{2}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \frac{-1}{1} \\ & \frac{1}{n} \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | －1 | 윽 | 込 |
| In［］（array） |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The AryToString instruction takes the elements of a BYTE array，In［］，from $\operatorname{In}[0]$ as character codes and stores them in text string Out．A NULL character is placed at the end of Out．Size specifies the number of elements of $\operatorname{In}[]$ to convert．If there is a NULL character between $\operatorname{In}[0]$ and $\operatorname{In}[S i z e-1]$ ，no character codes past it are stored in Out．

The following example is for when Size is UINT\#3.

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- The value of Size exceeds the array area of In[].
- The conversion result exceeds the valid range of Out.

## DispartDigit

The DispartDigit instruction separates a bit string into 4－bit units．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DispartDigit | Four－bit Separation | FUN |  | DispartDigit（In，Num，Ary－ Out）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Data to separate | Input | Bit string to separate | Depends on data type． | －－－ | ＊ |
| Num | Number of digits to separate |  | Number of digits to separate | 0 to No．of bits in In |  | 1 |
| AryOut［］ （array） | Separation results array | In－out | Separation results array | 16\＃00 to 16\＃0F | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 眔 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{\substack{C}}{\subseteq}$ | $\underset{\underset{i}{\mathrm{E}}}{\substack{\mathrm{O}}}$ | $\frac{C}{\bar{Z}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{2}$ | ${\overline{\underset{j}{1}}}_{\bar{K}}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \stackrel{N}{8} \end{aligned}$ | $\frac{-1}{\overline{3}}$ | 号 | -1 | 머 | 永 |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The DispartDigit instruction separates data to separate In into 4－bit units（digits）and stores them in separation results array AryOut［］．
First，In is separated into 4－bit units．Then，the lowest 4 bits are stored in AryOut［0］．AryOut［0］is BYTE data，so $16 \# 0$ is stored in bits 4 to 7 ．This process is repeated for the number of digits that is specified in number of digits to separate Num．

The following example is for when Num is USINT\#3.

## Additional Information

Use the UniteDigit_** instruction (page 2-447) to join 4-bit units from array elements.

## Precautions for Correct Use

- The values in AryOut[] do not change if the value of Num is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- The value of Num is outside of the valid range.
- The value of Num exceeds the array area of AryOut[].
- AryOut[] is not a BYTE array.
- An array without a subscript is passed to AryOut[].

## UniteDigit

The UniteDigit＿＊＊instructions join 4－bit units of data into a bit string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| UniteDigit＿＊＊ | Four－bit Join Group | FUN |  | Out：＝UniteDigit＿＊＊（In， Num）； <br> must be a bit string data type． |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\operatorname{In}[]$（array） | Array to join | Input | Array to join | Depends on data type． | －－－ | ＊ |
| Num | Number of digits to join |  | Number of digits to join | 0 to No．of bits in Out |  | 1 |
| Out | Joined result | Output | Bit string with joined result | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\underset{\substack{\text { D } \\ \hline \\ \hline}}{ }$ | $\begin{aligned} & \sum \\ & \text { § } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\sum_{0}^{C}$ D | $\frac{C}{\underset{Z}{\varrho}}$ | $\underset{\substack{C}}{\subseteq}$ | $\underset{\underset{1}{C}}{\substack{\text { C }}}$ | $\stackrel{C}{\underset{-1}{C}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 은 }}{ }$ | $\sum_{-1}$ | $\begin{aligned} & \text { D } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \text { R } \end{aligned}$ | $\stackrel{-1}{3}$ | 号 | －1 | 먹 | 号 |
| In［］（array） |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The UniteDigit＿＊＊instructions join 4－bit units from the elements of array to join In［］．It creates a bit string in joined result Out．（Four bits is one digit．）
Number of digits to join Num specifies the number of array elements to join．First，the lower four bits from each element from $\operatorname{In}[0]$ to $\operatorname{In}[N u m-1]$ are joined to create a bit string with Num digits．To this，16\＃0 is added to the upper digits for the number of digits of Out minus the value of Num．The result is stored in Out．
The name of the instruction is determined by the data type of Out．For example，if Out is the WORD data type，the instruction is UniteDigit＿WORD．

The following example shows the UniteDigit_WORD instruction when Num is USINT\#3.

## Additional Information

Use the DispartDigit instruction (page 2-445) to separate a bit string into 4-bit units.

## Precautions for Correct Use

- If the value of Num is 0 , the value of Out is 0 .
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Num is outside of the valid range.
- The value of Num exceeds the array area of $\operatorname{In}[]$.
- In[] is not a BYTE array.
- An array without a subscript is passed to $\operatorname{In}[]$.

## Dispart8Bit

The Dispart8Bit instruction separates a bit string into individual bytes．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Dispart8Bit | Byte Data Separation | FUN |  | Dispart8Bit（In，Num，Ary－ Out）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Data to separate | Input | Bit string to separate | Depends on data type． | －－－ | ＊ |
| Num | Number of bytes to separate |  | Number of bytes to separate | 0 to No．of bytes in In |  | 1 |
| AryOut［］ （array） | Separation results array | In－out | Separation results array | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  |  | Bit st | rings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { imes, } \\ & \text { s. } \text { an } \end{aligned}$ | dura |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { ロ0 } \\ & \text { ᄋ } \end{aligned}$ | $\underset{\text { m }}{\substack{\text { m }}}$ | $\begin{aligned} & \text { K } \\ & \text { Oㅁㅁ } \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \text { O } \\ & \text { 品 } \end{aligned}$ | $\begin{aligned} & \text { 㫘 } \\ & \text { 另 } \end{aligned}$ |  | $\underset{\substack{\mathrm{Z}}}{\substack{ \\\hline}}$ | $\underset{\sum_{1}}{\text { C }}$ | $\underset{\underset{-1}{c}}{\substack{c}}$ | $\sum_{-1}^{\infty}$ | E | $\underset{\substack{\mathrm{Z}}}{\square}$ | $\sum_{\lambda}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{m}{2} \end{aligned}$ |  | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | ō | 막 | 号 |
| In |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The Dispart8Bit instruction separates data to separate In into individual bytes and stores them in sepa－ ration results array AryOut［］．
First，In is separated into bytes．Then，the lowest byte is stored in AryOut［0］．Then，the next byte is stored in AryOut［1］．This process is repeated for the number of bytes that is specified in number of bytes to separate Num．

The following example is for when Num is USINT\#3.

## Additional Information

Use the Unite8Bit_** instruction (page 2-451) to join 1-byte units from array elements.

## Precautions for Correct Use

- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and AryOut[] will not change.
- The value of Num is outside of the valid range.
- The value of Num exceeds the number of bytes in In.
- AryOut[] is not a BYTE array.
- An array without a subscript is passed to AryOut[].

## Unite8Bit＿＊＊

The Unite8Bit＿＊＊instructions join bytes of data into a bit string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Unite8Bit＿＊＊ | Byte Data Join Group | FUN |  | Out：＝Unite8Bit＿＊＊（In，Num）； ＂＊＊＂must be a bit string data type． |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\operatorname{In}[]$（array） | Array to join | Input | Array to join | Depends on data type． | －－－ | ＊ |
| Num | Number of bytes to join |  | Number of bytes to join | 0 to No．of bytes in Out |  | 1 |
| Out | Joined result | Output | Bit string with joined result | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\underset{\substack{\text { D } \\ \hline \\ \hline}}{ }$ | $\begin{aligned} & \sum \\ & \text { § } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\sum_{0}^{C}$ D | $\frac{C}{\underset{Z}{\varrho}}$ | $\underset{\substack{C}}{\subseteq}$ | $\underset{\underset{1}{C}}{\substack{\text { C }}}$ | $\stackrel{C}{\underset{-1}{C}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 은 }}{ }$ | $\sum_{-1}$ | $\begin{aligned} & \text { D } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \text { R } \end{aligned}$ | $\stackrel{-1}{3}$ | 号 | －1 | 먹 | 号 |
| In［］（array） |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The Unite8Bit＿＊＊instructions join elements of array to join In［］to create a bit string in joined result Out．
Number of bytes to join Num specifies the number of array elements to join．First，In［0］to In［Num－1］are joined to create a bit string with Num bytes．To this，16\＃00 is added to the upper bytes for the number of bytes of Out minus the value of Num．The result is stored in Out．
The name of the instruction is determined by the data type of Out．For example，if Out is the DWORD data type，the instruction is Unite8Bit＿DWORD．

The following example shows the Unite8Bit_DWORD instruction when Num is USINT\#3.

## Additional Information

Use the Dispart8Bit instruction (page 2-449) to separate a bit string into 1-byte units.

## Precautions for Correct Use

- If the value of Num is 0 , the value of Out is 0 .
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Num is outside of the valid range.
- The value of Num exceeds the array area of $\operatorname{In}[]$.
- In[] is not a BYTE array.
- An array without a subscript is passed to $\operatorname{In}[]$.

## ToAryByte

The ToAryByte instruction separates a variable into bytes and stores the bytes in a BYTE array．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ToAryByte | Conversion to Byte Array | FUN |  | Out：＝ToAryByte（In，Order， AryOut）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Data to convert | Input | Data to convert | Depends on data type． | －－－ | ＊ |
| Order | Conversion order |  | Conversion order | ＿LOW＿HIGH or HIGH＿LOW |  | $\begin{aligned} & \text { _LOW } \\ & \text { _HIGH } \end{aligned}$ |
| AryOut［］ （array） | Conversion results array | In－out | Conversion results array | Depends on data type． | －－－ | －－－ |
| Out | Number of ele－ ments in result | Output | Number of elements in result | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 罝 } \end{aligned}$ | $\begin{aligned} & \text { 思 } \\ & \underset{m}{2} \end{aligned}$ | 员 | 0 0 0 0 0 | § | $\sum_{\underset{1}{C}}^{\substack{C}}$ | ${\underset{z}{2}}_{\substack{c}}$ | 亳 | $\sum_{\underset{1}{c}}^{\substack{c}}$ | $\sum_{Z}^{\infty}$ | $\overline{\text { E }}$ | $\frac{0}{2}$ | $\sum_{-1}$ | $\stackrel{\text { ग }}{\text { T }}$ |  | $\begin{aligned} & -\frac{1}{2} \\ & \vdots \\ & \hline 1 \end{aligned}$ | 号 | －7 | 다 |  |
| In | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| in | An enumeration，array，array element，structure，or structure member can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Order | Refer to Function for the enumerators for the enumerated type＿eBYTE＿ORDER． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| AryOut［］ （array） |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The ToAryByte instruction separates the value of data to convert In into individual bytes and stores them in order in conversion results array AryOut［］starting from AryOut［0］．Number of elements in result Out contains the number of elements stored in AryOut［］．
Conversion order Order specifies the order in which to convert the value of $I n$ to bytes．The data type of Order is enumerated type＿eBYTE＿ORDER．The meaning of the enumerators are as follows：

| Enumerator | Meaning |
| :---: | :--- |
| ＿LOW＿HIGH | Lower byte first，higher byte last |
| ＿HIGH＿LOW | Higher byte first，lower byte last |

## When the Data Type of In Is Two Bytes or Larger

If the data type of $I n$ is two bytes or larger, In is separated into bytes and stored in AryOut[]. The following data types have two bytes or more.

| Classification | Data type |
| :--- | :--- |
| Bit strings | WORD, DWORD, and LWORD |
| Integers | UINT, UDINT, ULINT, INT, DINT, and LINT |
| Real numbers | REAL and LREAL |
| Times, durations, dates, <br> and text strings | TIME, DATE, TOD, DT, and STRING types of two bytes or more |
| Others | An enumeration, an array for which the total for all elements is 2 bytes or more, an <br> array element that is 2 bytes or more, a structure for which the total for all members is <br> 2 bytes or more, or a structure member that is 2 bytes or more |

The processing procedure is as follows:
1 First, the value in In is separated into words (two bytes).
2 The lowest word is separated into bytes.
3 If Order is _LOW_HIGH, the lower byte is stored in AryOut[0] and the higher byte is stored in AryOut[1]. If Order is _HIGH_LOW, the higher byte is stored in AryOut[0] and the lower byte is stored in AryOut[1].

4 The next word is separated into bytes and stored in AryOut[2] and AryOut[3] in the same way.
5 This process is repeated to the end of the value of In. If In is an array, the same process is repeated to the last element in In.
The following example is for when In is a DWORD array with three elements and Order is _LOW_HIGH.

The following example is for when In is the same as above and Order is _HIGH_LOW.

## When the Data Type of In Is One Byte

If the data type of $I n$ is one byte, In is stored in AryOut[] as one byte. The following data types have one byte.

| Classification | Data type |
| :--- | :--- |
| Bit strings | BYTE |
| Integers | USINT and SINT |
| Real numbers | None |
| Times, durations, dates, <br> and text strings | STRING types with one byte |
| Others | An array for which the total for all elements is 1 byte, an array element that is 1 byte, a <br> structure for which the total for all members is 1 byte, or a structure member that is 1 <br> byte. |

The following storage method is used.

| Value of <br> Order | In (array or not) | Storage method in AryOut[] |
| :--- | :--- | :--- |
| $\_$LOW_HIGH | Not an array | Value of $\operatorname{In}$ is stored in AryOut[O]. |
|  | Array | Value of $\operatorname{In}[i]$ is stored in AryOut $[i]$. |
| $\_$HIGH_LOW | Not an array | Value of $\operatorname{In}$ is stored in AryOut[1]. <br> $16 \# 00$ is stored in AryOut[0]. |
|  | Array | In[i] (where $i$ is even) is stored in AryOut[i+1]. <br> In[i] (where $i$ is odd) is stored in AryOut $[i-1]$. <br> If the number of elements in $\operatorname{In}[]$ is odd, 16\#00 is stored last in AryOut $[n-1]$. |

The following example is for when $I n$ is a SINT array with three elements and Order is _LOW_HIGH.

The following example is for when In is the same as above and Order is _HIGH_LOW.

## When In Is BOOL Data

If the data type of $I n$ is BOOL (one bit), data is stored in AryOut[] as described below.

| Value of Order | In (array or not) | Storage method in AryOut[] |
| :---: | :---: | :---: |
| _LOW_HIGH | Not an array | The logical OR of the value of In and 16\#00 is stored in AryOut[0]. |
|  | Array | Values of $\operatorname{In}[0]$ to $\operatorname{In}[7]$ are joined and stored in AryOut[0]. Values of $\operatorname{In}[8]$ to $\operatorname{In}[15]$ are joined and stored in AryOut[1]. The same process is repeated to store the rest of the data. If there is not sufficient data in $\operatorname{In}[]$ for 8 values, FALSE is added to the most-significant bit. <br> The value of Out is always even. If there are not sufficient bit values, the remaining values will all be FALSE. |
| _HIGH_LOW | Not an array | The logical OR of the value of In and 16\#00 is stored in AryOut[1]. 16\#00 is stored in AryOut[0] |
|  | Array | Values of $\operatorname{In}[0]$ to $\operatorname{In}[7]$ are joined and stored in AryOut[1]. Values of $\operatorname{In}[8]$ to $\operatorname{In}[15]$ are joined and stored in AryOut[0]. The same process is repeated to store the rest of the data. The value of Out is always even. If there are not sufficient bit values, the remaining values will all be FALSE. |

The following example is for when In is a BOOL array with 21 elements and Order is _LOW_HIGH.

The following example is for when $I n$ is the same as above and Order is _HIGH_LOW.

## Precautions for Correct Use

- If $I n$ is STRING data, the text string is not converted to numbers. The contents of the variable is taken as a bit string and converted to a byte array.
- If In is a structure, adjustment areas between members may be inserted into AryOut[].
- If the value of Order is _HIGH_LOW and the total number of bytes in In is an odd number, 16\#00 is added to the end of $I n$ to make an even number of bytes before the conversion is started.
- An error occurs in the following cases. ENO will be FALSE, and Out and AryOut[] will not change.
- The value of Order is outside of the valid range.
- The conversion result exceeds the array area of AryOut[].

## AryByteTo

The AryByteTo instruction joins BYTE array elements and stores the result in a variable．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryByteTo | Conversion from Byte Array | FUN |  | AryByteTo（In，Size，Order， OutVal）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In［］（array） | Array to convert | Input | Array to convert | Depends on data type． | －－－ | ＊ |
| Size | Number of elements to convert |  | Number of elements in $\operatorname{In}[]$ to convert |  |  | 1 |
| Order | Conver－ sion order |  | Conversion order | ＿LOW＿HIGH or <br> ＿HIGH＿LOW |  | $\begin{array}{\|l\|l} \hline \text { _LOW } \\ \text { _HIGH } \end{array}$ |
| OutVal | Conver－ sion result | In－out | Conversion result | Depends on data type． | －－－ | －－－ |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  | $\begin{aligned} & \text { © } \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\underset{\sim}{\text { ロ⿴囗㐅 }}$ | ミ O O | $\begin{aligned} & \text { O} \\ & \sum_{0}^{0} \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O} \\ & \text { D } \end{aligned}$ |  | $\underset{\underset{1}{C}}{\substack{C}}$ |  | $\stackrel{\substack{\text { c }}}{\text { ¢ }}$ | $\sum_{-1}^{\infty}$ | $\underset{i}{ }$ | $\underset{-1}{\square}$ | $\underset{\underset{-1}{ }}{\bar{r}}$ | $\begin{aligned} & \text { D } \\ & \stackrel{N}{\mathbb{N}} \end{aligned}$ | 「 T T | －긏 | 号 | －1 | 먹 |  |
| In［］（array） |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Order | Refer to Function for the enumerators for the enumerated type＿eBYTE＿ORDER． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| OutVal | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
|  | An enumeration，array，array element，structure，or structure member can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryByteTo instruction takes the first Size elements in array to convert $\operatorname{In}[]$ and joins them to match the size of the data type of conversion result OutVal．It then stores the result in OutVal．

Order specifies the order to join the elements of In[]. The data type of Order is enumerated type _eBYTE_ORDER. The meaning of the enumerators are as follows:

| Enumerators | Meaning |
| :---: | :---: |
| _LOW_HIGH | Lower byte first, higher byte last |
| _HIGH_LOW | Higher byte first, lower byte last |

## When the Data Type of OutVal Is Two Bytes or Larger

If the data type of OutVal is two bytes or larger, elements from In[] are joined so that the result is just large enough for the size of the data type of OutVal. The result is stored in OutVal. The following data types have two bytes or more.

| Classification | Data type |
| :--- | :--- |
| Bit strings | WORD, DWORD, and LWORD |
| Integers | UINT, UDINT, ULINT, INT, DINT, and LINT |
| Real numbers | REAL and LREAL |
| Times, durations, dates, and <br> text strings | TIME, DATE, TOD, DT, and STRING types of two bytes or more |
| Others | An enumeration, an array for which the total for all elements is 2 bytes or more, <br> an array element that is 2 bytes or more, a structure for which the total for all <br> members is 2 bytes or more, or a structure member that is 2 bytes or more |

The processing procedure is as follows:
$1 \operatorname{In}[0]$ and $\operatorname{In}[1]$ are joined according to the value of Order to create one word (two bytes) of data. If Order is _LOW_HIGH, the higher byte is stored in In[1] and the lower byte is stored in In[0]. If Order is _HIGH_LOW, the higher byte is stored in In[0] and the lower byte is stored in In[1].

2 In the same way elements that start from $\operatorname{In}[2]$ and $\operatorname{In}[3]$ are joined to make more words of data.
3
The words of data are joined to match the size of the data type of OutVal. For example, if OutVal is DWORD data, four individual words of data are joined.
4 The resulting data is stored in OutVal.

The following example is for when OutVal is DWORD data, Size is UINT\#4, and Order is _LOW_HIGH.

The following example is for when OutVal is the same as above, Size is UINT\#4, and Order is _HIGH_LOW.

Size $=$ UINT\#4

| $\operatorname{In}[0]$ | BYTE\#16\#67 |  | OutVal | DWORD\#16\#23016745 |
| :---: | :---: | :---: | :---: | :---: |
| $\ln [1]$ | BYTE\#16\#45 | - |  |  |
| $\ln [2]$ | BYTE\#16\#23 | - |  |  |
| $\ln [3]$ | BYTE\#16\#01 |  |  |  |

## When the Data Type of OutVal Is One Byte

If the data type of OutVal is one byte, one byte of $\operatorname{In}[]$ is stored directly in OutVal.
The following data types have one byte.

| Classification | Data type |
| :--- | :--- |
| Bit strings | BYTE |
| Integers | USINT and SINT |
| Real numbers | None |
| Times, durations, dates, and <br> text strings | STRING types with one byte |
| Others | An array for which the total for all elements is 1 byte, an array element that is 1 <br> byte, a structure for which the total for all members is 1 byte, or a structure <br> member that is 1 byte. |

The following storage method is used.

| Value of Order | OutVal (array or not) | Storage method in OutVal |
| :---: | :---: | :---: |
| _LOW_HIGH | Not an array | Value of In[0] is stored in OutVal |
|  | Array | Value of In[i] is stored in OutVal[i] |
| _HIGH_LOW | Not an array | Value of $\operatorname{In}[1]$ is stored in OutVal |
|  | Array | $\operatorname{In}[i]$ (where $i$ is even) is stored in OutVal[ $[i+1]$. <br> $\operatorname{In}[i]$ (where $i$ is odd) is stored in OutVal[ $[i-1]$. <br> If the value of Size is odd, data is stored up to OutVal[Size] and 16\#00 is stored in OutVal[Size-1]. |

The following example is for when OutVal is a SINT array with three elements, Size is UINT\#3, and Order is _LOW_HIGH.

| Size $=$ UINT\#3 | $\begin{aligned} & \operatorname{In}[0] \\ & \operatorname{In}[1] \end{aligned}$ | BYTE\#16\#01 | $\rightarrow$ OutVal[0] | SINT\#1 |
| :---: | :---: | :---: | :---: | :---: |
|  |  | BYTE\#16\#02 | $\rightarrow$ OutVal[1] | SINT\#2 |
|  | $\ln [2]$ | BYTE\#16\#03 | $\longrightarrow$ OutVal[2] | SINT\#3 |

The following example is for when OutVal and Size are the same as above and Order is _HIGH_LOW.

| Size = UINT\#3 | $\begin{aligned} & \ln [0 \\ & \ln [1 \\ & \ln [2 \end{aligned}$ | BYTE\#16\#01 | OutVal[0] | SINT\#2 |
| :---: | :---: | :---: | :---: | :---: |
|  |  | BYTE\#16\#02 | OutVal[1] | SINT\#1 |
|  |  | BYTE\#16\#03 | OutVal[2] | SINT\#0 |
|  |  |  | OutVal[3] | SINT\#3 |

## When OutVal Is BOOL Data

If the data type of OutVal is BOOL (one bit), data is stored in OutVal as described below.

| Value of <br> Order | OutVal <br> (array or not) | Storage method in OutVal |
| :--- | :--- | :--- |
| _LOW_HIGH | Not an array | Value of bit 0 of $\operatorname{In}[0]$ is stored in OutVal. |
|  | Array | Value of $\operatorname{In}[0]$ is separated and stored in OutVal[0] to OutVal[7]. Value <br> of $\operatorname{In}[1]$ is separated and stored in OutVal[8] to OutVal[15]. The same <br> process is repeated to store the rest of the data. <br> Remaining bits are discarded. |
|  | Not an array | Value of bit 0 of In[1] is stored in OutVal. |
|  | Array | Value of $\operatorname{In}[0]$ is separated and stored in OutVal[8] to OutVal[15]. Value <br> of $\operatorname{In}[1]$ is separated and stored in OutVal[0] to OutVal[7]. The same <br> process is repeated to store the rest of the data. <br> Remaining bits are discarded. |

The following example is for when OutVal is a BOOL array with 21 elements, Size is UINT\#3, and Order is _LOW_HIGH.

The following example is for when OutVal and Size are the same as above and Order is _HIGH_LOW.

| Size $=$ UINT\# |  | BYTE\#16\#89 |  | TRUE |
| :---: | :---: | :---: | :---: | :---: |
|  | $\ln [1]$ | BYTE\#16\#45 |  | FALSE |
|  | $\ln [2]$ | BYTE\#16\#04 |  | TRUE |
|  |  |  |  | FALSE |
|  |  |  |  | FALSE |
|  |  |  |  | FALSE |
|  |  |  |  | TRUE |
|  |  |  |  | FALSE |
|  |  |  |  | TRUE |
|  |  |  |  | FALSE |
|  |  |  |  | FALSE |
|  |  |  |  | TRUE |
|  |  |  |  | FALSE |
|  |  |  |  | FALSE |
|  |  |  |  | FALSE |
|  |  |  |  | TRUE |
|  |  |  |  | Not changed. |
|  |  |  |  | Not <br> changed. |
|  |  |  |  | Not <br> changed |
|  |  |  |  | Not changed. |
|  |  |  |  | $\begin{aligned} & \text { Nat } \\ & \text { changed. } \\ & \text { che } \end{aligned}$ |

## Precautions for Correct Use

- If OutVal is a structure, some of the values of $\operatorname{In}[]$ may be inserted in adjustment areas between members depending on the composition.
- If the value of Size is 0 , the value of Out will be TRUE and OutVal will not change.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and OutVal will not change.
- The value of Order is outside of the valid range.
- The value of Size exceeds the number of elements in In[].

## SizeOfAry

The SizeOfAry instruction gets the number of elements in an array.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SizeOfAry | Get Number of Array Elements | FUN |  | Out:=SizeOfAry(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\operatorname{In}[]$ (array) | Array | Input | Array | Depends on data type. | --- | * |
| Out | Number of <br> elements | Output | Number of elements | Depends on data type. | --- |  |

* If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

The SizeOfAry instruction gets the number of elements in array In[]. For the input parameter, use an array name, such as array, and not an array element name, such as array[0].
The following figure shows a programming example.

| Variable | Data type |
| :---: | :---: |
| abc | ARRAY[0..3] OF INT |

## Additional Information

$\operatorname{In}[]$ can be an array with two or more dimensions. Out will contain the total number of elements for all dimensions of $\operatorname{In}[]$. For example, if the input parameter that is passed to $\operatorname{In}[]$ is $A R R A Y[0 . .1,0 . .2]$, the value of Out will be UINT\#6.

| Variable | Data type |
| :---: | :---: |
| abc | ARRAY[0..1,0..2] OF BOOL |

## Stack and Table Instructions

| Instruction | Name | Page |
| :--- | :--- | :--- |
| StackPush | Push onto Stack | $2-466$ |
| StackFIFO and StackLIFO | First In First Out/Last In First Out | $2-475$ |
| StackIns | Insert into Stack | $2-478$ |
| StackDel | Delete from Stack | $2-480$ |
| RecSearch | Record Search | $2-482$ |
| RecRangeSearch | Range Record Search | $2-487$ |
| RecSort | Record Sort | $2-492$ |
| RecNum | Get Number of Records | $2-497$ |
| RecMax and RecMin | Maximum Record Search/ <br> Minimum Record Search | $2-499$ |

## StackPush

The StackPush instruction stores a value at the top of a stack.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StackPush | Push onto Stack | FUN |  | StackPush(In, InOut, Size, Num); |

## Variables

| Name | Meaning | 1/0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Input value | Input | Value, structure, or structure member to place in the stack | Depends on data type. | --- | --- |
| Size | Number of stack elements |  | Number of stack array elements |  |  | 1 |
| InOut[] (array) | Stack array | In-out | Array that functions as stack | Depends on data type. | --- | --- |
| Num | Number of stored elements |  | Number of elements stored in stack |  |  |  |
| Out | Return value | Output | Always TRUE | TRUE only | --- | --- |

|  | $\begin{aligned} & \text { O} \\ & \frac{0}{0} \\ & \frac{0}{0} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times, durations, dates, and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \\ & \text { ㅇ } \end{aligned}$ | $\begin{aligned} & \text { 䍗 } \\ & \hline \end{aligned}$ | $\sum$ 0 0 | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & 0 \\ & \hline 0 \end{aligned}$ | $\underset{\underset{1}{6}}{\substack{C}}$ | $\underset{-1}{C}$ | $\underset{\substack{\text { C } \\ \text { C }}}{ }$ |  | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\sum_{1}$ | $\sum_{-1}^{0}$ | $\sum_{\underset{1}{5}}^{\Gamma}$ | $\begin{aligned} & \mathbb{D} \\ & \stackrel{\pi}{\mathbb{2}} \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | - 긏 | 号 | 음 | 먹 |  |
| In | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| In | An enumeration, structure, or structure member can also be specified. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut[] (array) | Must be an array with elements that have the same data type as In. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The instruction assumes that there are number of stored elements Num elements stored in stack array InOut[]. Input value In is written to the next element, InOut[Num]. Then, Num is incremented. For number of stack elements Size, specify the number of elements in InOut[] to use as a stack.

The following example is for when Size is UINT\#5 and Num is UINT\#2.

Incremented

## Additional Information

Use the StackFIFO or StackLIFO instruction (page 2-475) to remove the bottom or top value that was stored in the stack.

## Precautions for Correct Use

- Use the same data type for In and the elements of InOut[].
- When an element in the array is passed to InOut[], all elements below the passed element are processed.
- The value of InOut[] or Num does not change if the value of Size is 0 .
- When $I n$ is an enumeration, always use a variable for the input parameter to pass to $I n$. A building error will occur if a constant is passed.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut[] will not change.
- In and InOut[] contain different data types.
- The value of Size is not 0 and Num is greater than or equal to Size.
- The value of Size exceeds the array area of InOut [] .
- In is STRING data and it does not end in a NULL character.
- In and InOut[] are STRING data and the number of bytes in In exceeds the size of InOut[].

## Sample Programming

The array variable $\operatorname{stcA}[0 . .9]$ is used as a stack. As preparations, three values (UINT\#1111, UINT\#2222, and UINT\#3333) are stored in the stack.

| stcA[0] | 1111 |
| :---: | :---: |
| stcA[1] | 2222 |
| stcA[2] | 3333 |
| stcA[3] | 0 |
| stcA[4] | 0 |
| stcA[5] | 0 |
| stcA[6] | 0 |
| stcA[7] | 0 |
| stcA[8] | 0 |
| stcA[9] | 0 |

The StackPush instruction is used to store a new value (UINT\#4444) at the top of the stack stcA[3]. That means there will be four values in the stack.

StackPush instruction executed.

Then, the StackLIFO instruction is used to remove one value at the top of the stack stcA[3]. That means there will be three values in the stack.

StackLIFO instruction executed.

Finally, the StackIns instruction is used to insert a value (UINT\#5555) between stcA[1] and stcA[2]. That means there will be four values in the stack.

StackIns instruction executed.

LD

| Variable | Data type | Initial value |  |
| :--- | :--- | :--- | :--- |
| InitStc | BOOT | False | Stack initialization condition |
| stcANum | UINT | 0 | Number of stored elements |
| StcA | ARRAY[0..9] OF UINT | $[10(0)]$ | Stack array |
| StcASize | UINT | 0 | Number of stack elements |
| SetParaPush | BOOL | False | Execution condition to set StcAInVal. |
| StcAInVal | UINT | 0 | Value added by StackPush |
| StcAPushStat | BOOL | False | StackPush execution condition |
| StackPush_err | BOOL | False | StackPush error flag |
| StcALIFOStat | BOOL | False | StackLIFO execution condition |
| StcAOutVal | UINT | 0 | Value removed by StackLIFO |
| StackLIFO_err | BOOL | False | StackLIFO error flag |
| SetParalns | BOOL | False | Execution condition to set StcAInsVal and StcAOffset |
| StcAInsVal | UINT | 0 | Value inserted by StackIns |
| StcAOffset | UINT | 0 | Offset for StackIns |
| StcAInsStat | BOOL | False | StackIns execution condition |
| StackIns_err | BOOL | False | StackIns error flag |

Store three values in stack.

Set the value to add with StackPush.

Add data with StackPush instruction.

Remove data with StackLIFO instruction.

Processing after normal end of StackLIFO

Set the insert value and offset with StackInsh.

ST

| Variable | Data type | Initial value |  |
| :--- | :--- | :--- | :--- |
| InitStc | BOOL | False | Stack initialization condition |
| preInitStc | BOOL | False | Value of InitStc from previous task period |
| stcANum | UINT | 0 | Number of stored elements |
| StcA | ARRAY[0..9] OF UINT | $[10(0)]$ | Stack array |
| StcASize | UINT | 0 | Number of stack elements |
| StcAPushStat | BOOL | False | StackPush execution condition |
| preStcAPushStat | BOOL | False | Value of StcAPushStat from previous task period |
| StcAInVal | UINT | 0 | Value added by StackPush |
| StcAPush_OK | BOOL | False | StackPush normal end flag |
| StcAPushNormalEnd | BOOL | False | Processing after normal end of StackPush |
| StcAPushErrorEnd | BOOL | False | Processing after error end of StackPush |
| StcALIFOSStat | BOOL | False | StackLIFO execution condition |
| preStcALIFOStat | BOOL | False | Value of StcALIFOStat from previous task period |
| StcAOutVal | UINT | 0 | Value removed by StackLIFO |
| StcALIFO_OK | BOOL | False | StackLIFO normal end flag |
| StcALIFONormalEnd | BOOL | False | Processing after normal end of StackLIFO |
| StcALIFOErrorEnd | BOOL | False | Processing after error end of StackLIFO |
| StcAInsStat | BOOL | False | StackIns execution condition |
| preStcAInsStat | BOOL | False | Value of StcAInsStat from previous task period |
| StcAInsVal | UINT | 0 | Value inserted by StackIns |
| StcAOffset | UINT | 0 | Offset for StackIns |

## StackFIFO and StackLIFO

StackFIFO: Removes the bottom value from a stack.
StackLIFO: Removes the top value from a stack.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StackFIFO | First In First Out | FUN |  | StackFIFO(InOut, OutVal, Size, Num); |
| StackLIFO | Last In First Out | FUN |  | StackLIFO(InOut, OutVal, Size, Num); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Size | Number of stack elements | Input | Number of stack array elements | Depends on data type. | --- | 1 |
| InOut[] (array) | Stack array | In-out | Array that functions as stack | Depends on data type. | --- | --- |
| OutVal | Output value |  | Value or structure output from stack |  |  |  |
| Num | Number of stored elements |  | Number of elements stored in stack |  |  |  |
| Out | Return value | Output | Always TRUE | TRUE only | --- | --- |

## Function

The instruction assumes that there are number of stored elements Num elements stored in stack array InOut［］．The instruction removes a value from the stack and assigns it to output value OutVal．For num－ ber of stack elements Size，specify the number of elements in InOut［］to use as a stack．

## －StackFIFO

The StackFIFO removes the bottom value from a stack．Value of InOut［0］is assigned to OutVal．Then， all Num－ 1 elements from InOut［1］are shifted to the next lower element in the stack array．Then 0 is stored in InOut［Num－1］．Finally，Num is decremented．
The following example is for when Size is UINT\＃5 and Num is UINT\＃3．
LD

ST
StackFIFO（abc［1］，def，UINT\＃5，ghi）；

## - StackLIFO

The StackLIFO instruction removes the top value from a stack. Value of InOut[Num-1] is assigned to OutVal. Then, Num is decremented.
The following example is for when Size is UINT\#5 and Num is UINT\#2.

## Precautions for Correct Use

- Use the same data type for InOut[] and OutVal.
- When an element in the array is passed to InOut[], all elements below the passed element are processed.
- The values in InOut[], Num, and OutVal do not change if the value of Size or Num is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and OutVal will not change.
- InOut[] and OutVal have different data types.
- The values of Num and Size are not 0 and Num is greater than Size.
- The value of Size exceeds the array area of InOut[].
- InOut[] is a STRING array and any of the elements does not end in a NULL character.
- InOut[] is a STRING array and the number of bytes in the elements exceeds the size of OutVal.

## Sample Programming

Refer to the sample programming that is provided for the StackPush instruction (page 2-466).

## StackIns

The StackIns instruction inserts a value at a specified position in a stack．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| Stacklns | Insert into Stack | FUN |  | StackIns（In，InOut，Size， Num，Offset）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Insert value | Input | Value，structure，or structure member to insert into the stack | Depends on data type． | －－－ | ＊ |
| Size | Number of stack ele－ ments |  | Number of stack array elements |  |  | 1 |
| Offset | Offset |  | Position in stack at which to insert In |  |  | 0 |
| InOut［］ （array） | Stack array | In－out | Array that functions as stack | Depends on data type． | －－－ | －－－ |
| Num | Number of stored elements |  | Number of elements stored in stack |  |  |  |
| Out | Return value | Output | Always TRUE | TRUE only | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |

| In | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| In | An enumeration，structure，or structure member can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Offset |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut［］ （array） | Must be an array with elements that have the same data type as In． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The instruction assumes that there are number of stored elements Num elements stored in stack array InOut[]. Insert value In is inserted at the position specified by the offset Offset (InOut[Offset]). All higher elements, i.e., InOut[Offset] to InOut[Num-1], are moved to the next higher element in the stack array. Then, Num is incremented. For number of stack elements Size, specify the number of elements in InOut[] to use as a stack.
The following example is for when Size is UINT\#6, Num is UINT\#3 and Offset is UINT\#1.

ST

StackIns(INT\#2345, abc[1], UINT\#6, def, UINT\#1);

## Precautions for Correct Use

- Use the same data type for In and InOut[].
- When an element in the array is passed to InOut[], all elements below the passed element are processed.
- The values in InOut [] and Num do not change if the value of Size is 0 .
- When In is an enumeration, always use a variable for the input parameter to pass to In. A building error will occur if a constant is passed.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut[] will not change.
- In and InOut[] contain different data types.
- The value of Size is not 0 and Size is not greater than Num and Num is not greater than or equal to Offset.
- The value of Size exceeds the array area of InOut[].
- In is STRING data and it does not end in a NULL character.
- InOut[] is a STRING array and the number of bytes in the elements exceeds the size of OutVal.

## Sample Programming

Refer to the sample programming that is provided for the StackPush instruction (page 2-466).

## StackDel

The StackDel instruction deletes a value from a specified position in a stack．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StackDel | Delete from Stack | FUN |  | StackDel（InOut，Size，Num， Offset）； |

## Variables

| Name | Meaning |  |  | 1／0 |  | Description |  |  |  |  | Valid range |  |  |  |  | Unit |  |  | Default |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Size | Number of stack ele－ ments |  |  | Input |  | Number of stack array elements |  |  |  |  | Depends on data type． |  |  |  |  | －－－ |  |  | 1 |  |
| Offset | Offset |  |  |  |  | Offset of value to delete from stack |  |  |  |  |  |  |  |  |  | 0 |  |
| InOut［］ （array） | Stack array |  | In－out |  |  | Array that functions as stack |  |  |  |  | Depends on data type． |  |  |  |  |  |  |  | －－－ |  |  | －－－ |  |
| Num | Number of stored elements |  |  |  |  | Num in st | ber of ack | elem | ents | stored |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | Return value |  | Output |  |  | Always TRUE |  |  |  |  |  | TRUE only |  |  |  | －－－ |  |  | －－－ |  |  |  |
|  | $\begin{aligned} & \text { © } \\ & \stackrel{0}{0} \\ & \stackrel{0}{\beth} \end{aligned}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |  |  |
|  |  | $\begin{aligned} & \text { D } \\ & \text { In } \end{aligned}$ | $\begin{aligned} & \sum_{0} \\ & \text { D } \end{aligned}$ | 0 $\sum_{0}^{0}$ 0 | ミ O D |  | $\underset{\substack{C}}{\substack{ \\\hline}}$ | 들 | $\underset{\underset{i}{c}}{\stackrel{C}{2}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{Z}{2}}_{2}^{\square}$ | $\bar{Z}_{\underset{1}{2}}$ | $\begin{aligned} & \text { ग } \\ & \text { 苋 } \end{aligned}$ | 「 <br> T <br> $\stackrel{1}{*}$ | $\frac{-1}{\overline{3}}$ | $\begin{aligned} & \text { 믹 } \\ & \text { m } \end{aligned}$ | 음 | 먹 | O － 2 0 |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Offset |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut［］ （array） | Arrays of enumerations or structures can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  | Arrays of enumerations or structures can also be specified． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Num |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The instruction assumes that there are number of stored elements Num elements stored in stack array InOut［］．The value is deleted from the position specified by the offset Offset（InOut［Offset）．All higher elements，i．e．，InOut［Offset＋1］to InOut［Num－1］，are moved to the next lower element in the stack array． Then，Num is decremented．For number of stack elements Size，specify the number of elements in InOut［］to use as a stack．

The following example is for when Size is UINT\#6, Num is UINT\#3 and Offset is UINT\#1.

Decremented.

## Precautions for Correct Use

- When an element in the array is passed to InOut[], all elements below the passed element are processed.
- The values in InOut[] and Num do not change if the value of Size or Num is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut[] will not change.
- The values of Num and Size are not 0 and Size is not greater than or equal to Num and Num is not greater than Offset.
- The value of Size exceeds the array area of InOut[].

## RecSearch

The RecSearch instruction searches an array of structures for elements that match the search key with the specified method.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| RecSearch | Record Search | FUN |  | Out:=RecSearch(In, Size, Member, Key, Mode, InOutPos, Num); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In[] (array) | Array to search | Input | Array of structures to search | --- | --- | * |
| Size | Number of elements to search |  | Number of array elements to search | Depends on data type. |  | 1 |
| Member | Member to search |  | Member of $\operatorname{In}[]$ structure to search |  |  | * |
| Key | Search key |  | Search value |  |  |  |
| Mode | Search method |  | Search method | -LINEAR, -BIN_ASC, -BIN_DESC |  | ${\underset{R}{R}}^{\text {LINEA }}$ |
| InOutPos[] (array) | Element numbers of matching elements | In-out | Element numbers of matching elements | Depends on data type. | --- | --- |
| Out | Search result | Output | TRUE: There are elements that match conditions FALSE: There are no elements that match conditions | Depends on data type. | --- | --- |
| Num | Number of matches |  | Number of matches |  |  |  |

[^10]

## Function

The RecSearch instruction searches Size elements in the array of structures $\operatorname{In}[]$. The search range is therefore from $\operatorname{In}[0]$ to $\operatorname{In}[$ Size-1]. The instruction searches member to search Member in the structures for members that match the search key Key.
One of the members to search in the elements of $\operatorname{In}[]$ is passed as an argument to Member.
If any matching elements are found, the value of search result Out changes to TRUE. The element number of the matching element is assigned to InOutPos[0] and the number of matching elements is assigned to Num. If there is more than one matching element, the element number of the lowest matching element in $\operatorname{In}[]$ is assigned to InOutPos[0]. If there are no matching elements, the value of Out will be FALSE and InOutPos[0] and Num will be 0 .
Always attach the element number to input parameter that is passed to In[], e.g., array[3].
The data type of search method Mode is enumerated type _eSEARCH_MODE. The meanings of the enumerators are as follows:

| Enumerator | Meaning |
| :--- | :--- |
| _LINEAR | Linear search |
| _BIN_ASC | Ascending binary search |
| _BIN_DESC | Descending binary search |

For a linear search, the search is performed in order from the first element of $\operatorname{In}[]$.

The following example is for when Size is UINT\#5, Key is INT\#1234 and Mode is _LINEAR.

For an ascending binary search, the array elements in the input parameter that is passed to $\operatorname{In}[]$ must be in ascending order before this instruction is executed. Then a binary search is performed by executing this instruction.

Using the same example as before, the order of the array elements and the processing results will be as shown below for an ascending binary search.

For a descending binary search, the array elements in the input parameter that is passed to $\operatorname{In}[]$ must be in descending order before this instruction is executed. Then a binary search is performed by executing this instruction.
Using the same example as before, the order of the array elements and the processing results will be as shown below for a descending binary search.

## Additional Information

- In[] can be a member of a higher-level structure.

Example: In[0]=str0.str1[0]

- In[] can be an array with two or more dimensions. If $\operatorname{In}[]$ is a two-dimensional array, the element number in the first dimension of the element that matches the search conditions is assigned to InOut$\operatorname{Pos}[0]$ and the element number in the second dimension is assigned to InOutPos[1].
- If $\operatorname{In}[]$ is a three-dimensional array, the element number in the first dimension of the element that matches the search conditions is assigned to InOutPos[0], the element number in the second dimension is assigned to InOutPos[1], and the element number in the third dimension is assigned to InOutPos[2].

## Precautions for Correct Use

- When an element in the array is passed to $\operatorname{In}[]$, all elements below the passed element are processed.
- If Member is a real number, depending on the value of Member, the desired results may not be achieved due to error.
- If Key is a real number, do not specify nonnumeric data for Key.
- If the value of Size is 0 , the value of Out is FALSE and the value of Num is 0 . InOutPos[] does not change.
- The correct result is not obtained if the value of Mode is _BIN_ASC or _BIN_DESC and the elements of $\operatorname{In}[]$ are not in ascending or descending order. Place the elements in ascending or descending order before executing this instruction.
- An error occurs in the following cases. ENO will be FALSE, and Out, InOutPos[], and Num will not change.
- The value of Mode is outside of the valid range.
- The value of Size exceeds the array area of In[].
- Member is not a member of In[].
- The array size of InOutPos[] is smaller than the number of dimensions of $\operatorname{In}[]$.
- Member is not integer or real number data.
- Key and Member have different data types.
- In[] is not an array of structures.

## RecRangeSearch

The RecRangeSearch instruction searches an array of structures for elements that match the search condition range with the specified method.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| RecRangeSearch | Range Record Search | FUN |  | Out:=RecRangeSearch(In, Size, Member, MN, MX, Condition, Mode, InOutPos, Num); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In[] (array) | Array to search | Input | Array of structures to search | --- | --- | * |

| Num |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The RecRangeSearch instruction searches Size elements in the array of structures $\operatorname{In}[]$ ．The search range is therefore from $\operatorname{In}[0]$ to $\operatorname{In}[$ Size－1］．The instruction searches member to search Member in the structures for members that match the search condition．

Condition specifies the search condition．Mode specifies the search method．Details are provided below．One of the members to search in the elements of $\operatorname{In}[]$ is passed as an argument to Member．
If any elements that match the search condition are found，the value of search result Out changes to TRUE．The element number of the matching element is assigned to InOutPos［0］and the number of matching elements is assigned to Num．If there is more than one matching element，the element num－ ber of the lowest matching element in $\operatorname{In}[]$ is assigned to InOutPos［0］．If there are no matching elements， the value of Out will be FALSE and InOutPos［0］and Num will be 0 ．
Always attach the element number to input parameter that is passed to In［］，e．g．，array［3］．
The data type of search condition Condition is enumerated type＿eSEARCH＿CONDITION．The mean－ ings of the enumerators are as follows：

| Enumerator | Meaning |
| :--- | :--- |
| ＿EQ＿BOTH | $\mathrm{MN} \leq$ Member $\leq \mathrm{MX}$ |
| ＿EQ＿MIN | $\mathrm{MN} \leq$ Member $<\mathrm{MX}$ |
| ＿EQ＿MAX | $\mathrm{MN}<$ Member $\leq \mathrm{MX}$ |
| ＿NE＿BOTH | $\mathrm{MN}<$ Member＜MX |

The data type of search method Mode is enumerated type＿eSEARCH＿MODE．The meaning of the enumerators are as follows：

| Enumerator | Meaning |
| :--- | :--- |
| ＿LINEAR | Linear search |
| ＿BIN＿ASC | Ascending binary search |
| ＿BIN＿DESC | Descending binary search |

For a linear search，the search is performed in order from the first element of $\ln []$ ．

The following example is for when Size is UINT\#5, MN is INT\#1000, MX is INT\#2000, Condition is _EQ_BOTH and Mode is _LINEAR.

For an ascending binary search, the array elements in the input parameter that is passed to $\operatorname{In}[]$ must be in ascending order before this instruction is executed. Then a binary search is performed by executing this instruction.

Using the same example as before, the order of the array elements and the processing results will be as shown below for an ascending binary search.

| Condition=_EQ_BOTH | MN | INT\#1000 |
| :--- | :--- | :--- |
| Mode=_BIN_ASC | MX | INT\#2000 |

For a descending binary search, the array elements in the input parameter that is passed to $\operatorname{In}[]$ must be in descending order before this instruction is executed. Then a binary search is performed by executing this instruction.
Using the same example as before, the order of the array elements and the processing results will be as shown below for a descending binary search.

## Additional Information

- In[] can be a member of a higher-level structure.

Example: In[0]=str0.str1[0]

- In[] can be an array with two or more dimensions. If $\operatorname{In}[]$ is a two-dimensional array, the element number in the first dimension of the element that matches the search conditions is assigned to InOutPos[0] and the element number in the second dimension is assigned to InOutPos[1].
- If $\operatorname{In}[]$ is a three-dimensional array, the element number in the first dimension of the element that matches the search conditions is assigned to InOutPos[0], the element number in the second dimension is assigned to InOutPos[1], and the element number in the third dimension is assigned to InOutPos[2].

## Precautions for Correct Use

- Make the data types of Member, $M N$, and $M X$ the same as the data type of the members that are searched in In[].
- When an element in the array is passed to In[], all elements below the passed element are processed.
- If Member is a real number, depending on the value of Member, the desired results may not be achieved due to error.
- If $M N$ or $M X$ is a real number, do not specify nonnumeric data for $M N$ or $M X$.
- If the value of Size is 0 , the value of Out is FALSE and the value of Num is 0 . InOutPos[] does not change.
- The correct result is not obtained if the value of Mode is _BIN_ASC or _BIN_DESC and the elements of $\operatorname{In}[]$ are not in ascending or descending order. Place the elements in ascending or descending order before executing this instruction.
- An error occurs in the following cases. ENO will be FALSE, and Out, InOutPos[], and Num will not change.
- The data types of the member to search in $\operatorname{In}[], M N$, and $M X$ are different.
- $M N$ is greater than $M X$.
- The value of Condition is outside of the valid range.
- The value of Mode is outside of the valid range.
- The value of Size exceeds the array area of In[].
- Member is not a member of In[].
- The array size of InOutPos[] is smaller than the number of dimensions of In[].
- Member is not integer or real number data.
- MN, MX, and Member have different data types.
- In[] is not an array of structures.

## RecSort

The RecSort instruction sorts the elements of an array of structures．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| RecSort | Record Sort | FB |  | RecSort＿instance（Execute， InOut，Size，Member，Order， Done，Busy，Error）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Size | Number of elements to sort | Input | Number of array elements to sort | Depends on data type． | －－－ | 1 |
| Member | Member to sort |  | Member of $\operatorname{In}[]$ structure to sort |  |  | ＊ |
| Order | Sort order |  | Sort order | $\begin{aligned} & \text { _ASC, } \\ & \text { _DESC } \end{aligned}$ |  | ＿ASC |
| InOut［］ （array） | Sort array | In－out | Array of structures to sort | －－－ | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O <br> O <br> O | $\begin{aligned} & \text { 箵 } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{1} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{-1}{C}$ | ${\underset{i}{n}}_{\substack{C}}$ | $\frac{\mathrm{C}}{\sum_{1}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\bar{z}_{1}$ | ${\underset{Z}{2}}_{0}^{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 另 } \\ & \text { T } \\ & \hline \end{aligned}$ | $\frac{-1}{\overline{3}}$ | 号 | 움 | 먹 | 第 |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Momb |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Member | Specify the same data type as the sort member of InOut［］ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Order | Refer to Function for the enumerators of the enumerated type＿eSORT＿ORDER． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| InOut［］ （array） | Specify an array of structures． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

When the value of Execute is TRUE, Size elements of InOut[] (a structure array) is sorted. Specifically, the elements from InOut[0] to InOut[Size-1] are sorted. Specifically, the elements from InOut[0] to InOut[Size-1] are sorted. Order specifies the sort order. Details are provided below. One of the members to sort in the elements of $\operatorname{In}[]$ is passed as an argument to Member.
Always attach the element number to the in-out parameter that is passed to InOut[], e.g., array[3].
The data type of sort order Order is enumerated type _eSORT_ORDER. The meaning of the enumerators are as follows:

| Enumerator | Meaning |
| :--- | :--- |
| _ASC | Ascending |
| _DESC | Descending |

The following example is for when Size is UINT\#5, Member is 3456 and Order is _Asc.

## LD

ST

RecSort_instance(A, abc[0], UINT\#5, abc[0].m, _ASC, def, ghi, jkl);

## Additional Information

If the power supply is interrupted during execution of this instruction, the contents of InOut may be corrupted. If you back up the contents of InOut[] each time the instruction is completed normally, you can restore the data if it is corrupted. Refer to Sample Programming.

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- If Member is a real number, depending on the value of Member, the desired results may not be achieved due to error.
- When an element in the array is passed to InOut[], all elements below the passed element are processed.
- If the value of Size is 0 , the value of Done will be TRUE and InOut[] will not change.
- An error occurs in the following cases. Done and Busy will be FALSE and Error will be TRUE.
- The value of Order is outside of the valid range.
- The value of Size exceeds the array area of InOut[].
- Member is not a member of InOut[].
- Member is not integer or real number data.
- InOut[] is not an array of structures.

## Sample Programming

In this sample, the RecSort instruction is used to sort an array $A b c[]$ of MyStr structures in ascending order. The member to sort is $A b c[] . m$. To prevent loosing data even if power is interrupted during processing, $A b c[]$ is backed up in a variable named $A b c \_b a c k u p[]$ before sorting. If a power interruption occurs, the contents of $A b c$ _backup [] is restored to $A b c[]$ and the sort operation is redone.
Definitions of Global Variables
Data Types

| EndDat | Must be the same data type as Member． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The RecNum instruction searches from the start of an array $\operatorname{In}[]$（whose elements are structures）．The instruction searches for elements for which the value of member to process Member matches end data EndDat．As the result，it assigns the number of elements（records）up to the element just before the ele－ ment with an EndDat match to Out．One of the members to process in the elements of $I n[]$ is passed as an argument to Member．
Always attach the element number to input parameter that is passed to $\operatorname{In}[]$, e．g．，array［3］．

The following example is for when EndDat is INT\#9999.

## Additional Information

$\operatorname{In}[]$ can be a member of a higher-level structure.
Example: $\operatorname{In}[0]=s t r 0 . \operatorname{str} 1[0]$

## Precautions for Correct Use

- If there are no members in $\operatorname{In}[]$ that match EndDat, the total number of elements in $\operatorname{In}[]$ is assigned to Out.
- If Member is a real number, depending on the value of Member, the desired results may not be achieved due to error.
- If EndDat is a real number, do not specify nonnumeric data for it.
- When an element in the array is passed to $\operatorname{In}[]$, all elements below the passed element are processed.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- Member is not a member of In[].
- Member or EndDat is STRING data and it does not end in a NULL character.
- Member is not Boolean, integer, bit string, real number, or text string data.
- Member and EndDat have different data types.
- In[] is not an array of structures.

## RecMax and RecMin

RecMax：Searches the specified member in the structures of an array of structures for the maximum value．
RecMin：Searches the specified member in the structures of an array of structures for the minimum value．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| RecMax | Maximum Record Search | FUN |  | Out：＝RecMax（In，Size， Member，InOutPos，Num）； |
| RecMin | Minimum Record Search | FUN |  | Out：＝RecMin（In，Size， Member，InOutPos，Num）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |

## Function

These instructions search Size elements in an array of structures $\operatorname{In}[]$ ．The search range is therefore from $\operatorname{In}[0]$ to $\operatorname{In}[$ Size－1］．The instruction searches member to search Member in the structures．
One of the members to search in the elements of $\operatorname{In}[]$ is passed as an argument to Member．The ele－ ment number of the element with the maximum or minimum value is assigned to InOutPos［0］and the number of elements that were found is assigned to Num．If more than one element was found，the ele－ ment number of the lowest element with the maximum or minimum value in $\operatorname{In}[]$ is assigned to InOut－ Pos［0］．
Always attach the element number to input parameter that is passed to $\operatorname{In}[]$, e．g．，array［3］．

## －RecMax

The RecMax instruction searches for the maximum value．The maximum value of the member to search is assigned to search result Out．

## －RecMin

The RecMin instruction searches for the minimum value．The minimum value of the member to search is assigned to search result Out．
The following example shows the RecMax instruction when Size is UINT\＃5．

LD

ST
ghi：＝RecMax（abc［0］，UINT\＃5，abc［0］．m，def，jkl）；

## Additional Information

- In[] can be a member of a higher-level structure.

Example: $\operatorname{In}[0]=s t r 0 . \operatorname{str} 1[0]$

- In[] can be an array with two or more dimensions. If $\operatorname{In}[]$ is a two-dimensional array, the element number in the first dimension of the element that matches the search conditions is assigned to InOutPos[0] and the element number in the second dimension is assigned to InOutPos[1].
- If $\operatorname{In}[]$ is a three-dimensional array, the element number in the first dimension of the element that matches the search conditions is assigned to InOutPos[0], the element number in the second dimension is assigned to InOutPos[1], and the element number in the third dimension is assigned to InOutPos[2].

## Precautions for Correct Use

- If you use a different data type for Member and Out, use only the following data types and make sure the valid range of Out includes the valid range of Member.
- USINT, UINT, UDINT, ULINT, SINT, INT, DINT, LINT, REAL, and LREAL
- If Member is a real number, depending on the value of Member, the desired results may not be achieved due to error.
- When an element in the array is passed to In[], all elements below the passed element are processed.
- If the value of Size is 0 , the values of Out and Num are 0 . The values in InOutPos[] do not change.
- An error occurs in the following cases. ENO will be FALSE, and Out, InOutPos[], and Num will not change.
- The value of Size exceeds the array area of In[].
- Member is not a member of In[].
- The array size of InOutPos[] is smaller than the number of dimensions of In[].
- An array without a subscript is passed to In[].
- Member is not integer or real number data.

2 Instruction Descriptions

## FCS Instructions

| Instruction | Name | Page |
| :--- | :--- | :--- |
| StringSum | Checksum Calculation | $2-504$ |
| StringLRC | Calculate Text String LRC | $2-506$ |
| StringCRCCCITT | Calculate Text String CRC-CCITT | $2-508$ |
| StringCRC16 | Calculate Text String CRC-16 | $2-510$ |
| AryLRC_** | Calculate Array LRC Group | $2-512$ |

## StringSum

The StringSum instruction calculates the checksum for a text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StringSum | Checksum Calcula－ tion | FUN |  | Out：＝StringSum（In，Size）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Text string to process | Input | Text string to process | Depends on data type． | －－－ | ＂ |
| Size | Byte size |  | Byte size of checksum | 1 or 2 | Bytes | 1 |
| Out | Checksum | Output | Checksum | Number of bytes speci－ fied by Size | Bytes | －－－ |

|  |  |  | Bit s | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | nes | du |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Do } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 䛜 } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0_{0}^{0} \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O } \end{aligned}$ | $\underset{\sum_{-1}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{\text { 들 }}{\frac{1}{2}}$ | $\frac{\text { 득 }}{\overline{1}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 즉 }}{ }$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \mathbb{D} \\ & \xrightarrow[N]{2} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \stackrel{N}{2} \end{aligned}$ | $\begin{aligned} & \frac{-1}{3} \\ & \frac{1}{n} \end{aligned}$ | 号 | 음 | 먹 | O |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Size |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The StringSum instruction calculates the checksum of text string to process In．Checksum Out will be the number of bytes specified with byte size Size．Out is given as a hexadecimal text string with a NULL character stored at the end．
The following example is for when In is＇1234＇and Size is USINT\＃2．
LD ST
abc：＝StringSum（＇1234＇，USINT\＃2）；

Total calculated． Byte size Size＝USINT\＃2
Out＝abc＇CA＇
If Size was USINT\＃1 in the above example，Out would be＇A＇．

## Precautions for Correct Use

- If the sum of the character codes in In exceeds the number of digits of Size, the upper digits are discarded.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Size is outside of the valid range.
- In does not end in a NULL character.
- The number of bytes in $I n$ is 0 (i.e., the NULL character only).
- The size of the processing result exceeds the size of Out.

## StringLRC

The StringLRC instruction calculates the LRC value（horizontal parity）．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StringLRC | Calculate Text String LRC | FUN |  | Out：＝StringLRC（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :---: | :--- | :--- | :--- | :--- | :--- |
| In | Text string <br> to process | Input | Text string to process | Depends on data type． | --- | $"$ |
| Out | LRC value | Output | LRC value | 3 bytes max．（two sin－ <br> gle－byte alphanumeric <br> characters plus the final <br> NULL character） | --- | --- |

|  |  |  | t | gs |  |  |  |  | Inte |  |  |  |  |  |  |  | me <br> s， |  | ion | gs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 署 | $\begin{aligned} & \text { ロ } \\ & \text { 군 } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O} \\ & \text { D } \end{aligned}$ | $\frac{C}{\sum_{i}^{C 1}}$ | $\underset{\underset{J}{C}}{\substack{C}}$ | $\underset{\underset{i}{\text { 든 }}}{ }$ | $\frac{\mathrm{C}}{\underset{\lambda}{\mathrm{C}}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ |  | $\frac{-1}{\overline{3}}$ | 号 | 음 | 먹 |  |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The StringLRC instruction calculates the LRC value（horizontal parity）of text string to process In．The LRC value is the exclusive logical OR of the character codes for the text string in In．The LRC value （Out）is given as a hexadecimal text string with a NULL character stored at the end．
The following example is for when In is＇ 1234 ＇．

LD

## ST

 abc：＝StringLRC（＇1234＇）；

Exclusive logical OR

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- In does not end in a NULL character.
- The number of bytes in In is 0 (i.e., the NULL character only).
- The number of bytes for Out is outside of the valid range.

## StringCRCCCITT

The StringCRCCCITT instruction calculates the CRC－CCITT value using the XMODEM method．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StringCRCCCITT | Calculate Text String CRC－CCITT | FUN |  | Out：＝StringCRCCCITT（In， Initial，OutOrder）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Text string to process | Input | Text string to process | Depends on data type． | －－－ | ＂ |
| Initial | Initial value |  | Initial value of CRC－CCITT value |  |  | 0 |
| OutOrder | Byte order |  | Order to process bytes in In | ＿LOW＿HIGH， <br> ＿HIGH＿LOW |  | $\begin{aligned} & \text { _HIGH } \\ & \hline \end{aligned}$ |
| Out | CRC－ CCITT value | Output | CRC－CCITT value | 5 bytes（four single－ byte alphanumeric characters plus the final NULL character） | －－－ | －－－ |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 囹 | $\begin{aligned} & \text { 䟞 } \\ & \hline \end{aligned}$ | ミ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { O } \\ & \text { D } \end{aligned}$ | 「 O 号 | $\frac{C}{\underset{Z}{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{\text { 들 }}{n}$ | $\frac{\underset{1}{C}}{\underset{1}{C}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{N}{ㄴ}}^{\circ}$ | $\bar{K}_{\overline{1}}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 唯 } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\frac{-1}{\overline{3}}$ | 号 | 금 | 먹 | O |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Initial |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| OutOrder | Refer to Function for the enumerators of the enumerated type＿eBYTE＿ORDER． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The StringCRCCCITT instruction calculates the CRC－CCITT value of text string to process In using the XMODEM method．CRC－CCITT value Out is given as a hexadecimal text string with a NULL character stored at the end．
Set Initial to the initial value for CRC－CCITT value calculation．OutOrder specifies the byte order．
The data type of OutOrder is enumerated type＿eBYTE＿ORDER．The meanings of the enumerators are as follows：

| Enumerators | Meaning |
| :--- | :--- |
| ＿LOW＿HIGH | Lower byte first，upper byte last |
| ＿HIGH＿LOW | Upper byte first，lower byte last |

The following example is for when In is 'RD', Initial is WORD\#16\#0000, and OutOrder is _HIGH_LOW.

abc:=StringCRCCCITT('RD', WORD\#16\#0000, _HIGH_LOW);

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- The value of OutOrder is outside of the valid range.
- In does not end in a NULL character.
- The number of bytes in In is 0 (i.e., the NULL character only).
- The number of bytes for Out is outside of the valid range.

## StringCRC16

The StringCRC16 instruction calculates the CRC－16 value using the MODBUS method．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| StringCRC16 | Calculate Text String CRC－16 | FUN |  | Out：＝StringCRC16（In，Ini－ tial，OutOrder）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Text string to process | Input | Text string to process | Depends on data type． | －－－ | ＂ |
| Initial | Initial value |  | Initial value of CRC－16 value |  |  | $\begin{aligned} & \hline 16 \# F F F \\ & \mathrm{~F} \end{aligned}$ |
| OutOrder | Byte order |  | Order to process bytes in In | ＿LOW＿HIGH， <br> ＿HIGH＿LOW |  |  |
| Out | CRC－16 value | Output | CRC－16 value | 5 bytes（four single－ byte alphanumeric characters plus the final NULL character） | －－－ | －－－ |

|  | O <br> 0 <br> 0 <br> 0 <br>  |  | Bit s | ings |  |  |  |  | Inte | ers |  |  |  |  |  |  | me | dur | ion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 罟 | $\begin{aligned} & \text { 四 } \\ & \text { In } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { § } \\ & \text { D } \end{aligned}$ |  | $\sum_{0}$ O D | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\underset{\sim}{\text { 들 }}$ | $\frac{\mathrm{C}}{\sum_{1}}$ | $\underset{-1}{\infty}$ | $\bar{Z}$ | $\underset{\text { 믄 }}{ }$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { D } \\ & \text { 而 } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | 号 | 움 | 믹 | On |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Initial |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| OutOrder | Refer to Function for the enumerators of the enumerated type＿eBYTE＿ORDER． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The StringCRC16 instruction calculates the CRC－16 value of text string to process In using the MOD－ BUS method．CRC－16 value Out is given as a hexadecimal text string with a NULL character stored at the end．
Set Initial to the initial value for CRC－16 value calculation．OutOrder specifies the byte order．
The data type of OutOrder is enumerated type＿eBYTE＿ORDER．The meanings of the enumerators are as follows：

| Enumerators | Meaning |
| :--- | :--- |
| ＿LOW＿HIGH | Lower byte first，upper byte last |
| ＿HIGH＿LOW | Upper byte first，lower byte last |

The following example is for when In is '01', Initial is WORD\#16\#FFFF and OutOrder is _LOW_HIGH.
 ST

## abc:=StringCRC16('01', WORD\#16\#FFF

_LOW_HIGH);

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- The value of OutOrder is outside of the valid range.
- In does not end in a NULL character.
- The number of bytes in In is 0 (i.e., the NULL character only).
- The number of bytes for Out is outside of the valid range.

## AryLRC

The AryLRC＿＊＊instructions calculate the LRC value for an array．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryLRC－＊＊ | Calculate Array LRC Group | FUN |  <br> ＂＊＊＂must be a bit string data type． | Out：＝AryLRC＿＊＊（In，Size）； ＂＊＊＂must be a bit string data type． |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln []$（array） | Array to process | Input | Array to process | Depends on data type． | －－－ | ＊ |
| Size | Number of elements to process |  | Number of $\ln []$ elements |  |  | 1 |
| Out | LRC value | Output | LRC value | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 置 } \\ & \end{aligned}$ | $\begin{aligned} & \text { 䍗 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { D } \end{aligned}$ | 「 § 另 | $\frac{C}{\sum_{1}^{C}}$ | $\underset{\underset{-1}{C}}{\substack{C}}$ |  | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\sum_{-1}^{\infty}$ | $\bar{z}_{1}$ | ${\underset{N}{2}}_{0}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { ग } \\ & \text { m } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { 另 } \\ & \text { 罢 } \end{aligned}$ | $\stackrel{-1}{\overline{1}}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 움 | 먹 |  |
| In［］（array） |  | OK | OK | OK | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Size |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  | Mus | be | e | a t | e |  |  |  |  |  |  |  |  |

## Function

The AryLRC＿＊＊instructions calculate the LRC value（exclusive logical OR）of Size array elements of array to process $\operatorname{In}[]$ starting from $\operatorname{In}[0]$ ．The name of the instruction is determined by the data type of $\operatorname{In}[]$ ．For example，if $\operatorname{In}[]$ is the WORD data type，the instruction is AryLRC＿WORD．
Always attach the element number to in－out parameter that is passed to In［］，e．g．，array［3］．

The following example shows the AryLRC_WORD instruction when Size is UINT\#5.
LD ST

## Precautions for Correct Use

- Use the same data type for $\operatorname{In}[]$ and Out.
- If the value of Size is 0 , the value of Out is $16 \# 00$.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The value of Size exceeds the array area of In[].
- An array without a subscript is passed to $\operatorname{In}[]$.
- In[] is not an array of bit strings.

## AryCRCCCITT

The AryCRCCCITT instruction calculates the CRC－CCITT value using the XMODEM method．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryCRCCCITT | Calculate Array CRC－CCITT | FUN |  | Out：＝AryCRCCCITT（In， Size，Initial，OutOrder）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In［］（array） | Array to process | Input | Array to process | Depends on data type． | －－－ | ＊ |
| Size | Number of elements to process |  | Number of $\ln []$ elements |  |  | 1 |
| Initial | Initial value |  | Initial value of CRC－CCITT value |  |  | 0 |
| OutOrder | Byte order |  | Order to process bytes in In | ＿LOW＿HIGH， HIGH LOW |  | $\begin{aligned} & \text { _HIGH } \\ & \text { _LOW } \end{aligned}$ |
| Out | CRC－ CCITT value | Output | CRC－CCITT value | Depends on data type． | －－－ | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { ロ } \\ & \underset{\sim}{m} \end{aligned}$ | $\begin{aligned} & \sum_{0} \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ |  | $\underset{\substack{-1}}{C}$ |  | $\underset{\underset{1}{C}}{\stackrel{C}{E}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\sum_{-1}^{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { ग } \\ & \text { m } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { 䍗 } \\ & \end{aligned}$ | $\frac{-1}{\overline{3}}$ | $\begin{aligned} & \text { 另 } \\ & \text { n } \end{aligned}$ | 금 | 먹 | 第 |

| Out |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryCRCCCITT instruction calculates the CRC－CCITT value of Size elements of array to process $\operatorname{In}[]$ starting from $\operatorname{In}[0]$ ．The XMODEM method is used．
Set Initial to the initial value for CRC－CCITT value calculation．OutOrder specifies the byte order．

The data type of OutOrder is enumerated type _eBYTE_ORDER. The meaning of the enumerators are as follows:

| Enumerators | Meaning |
| :---: | :---: |
| _LOW_HIGH | Lower byte first, upper byte last |
| _HIGH_LOW | Upper byte first, lower byte last |

Always attach the element number to in-out parameter that is passed to In[], e.g., array[3].
The following example is for when Size is UINT\#2, Initial is WORD\#16\#0000, and OutOrder is _LOW_HIGH.

```
LD ST
ST
```

def:=AryCRCCCITT(abc[4], UINT\#2, WORD\#16\#0000, _LOW_HIGH);

## Precautions for Correct Use

- If the value of Size is 0 , the value of Out is WORD\#16\#00.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of OutOrder is outside of the valid range.
- The value of Size exceeds the array area of In[].
- An array without a subscript is passed to In[].
- The elements in In[] are not bit string, integer, real number, time, duration, date, or date and time data.

## AryCRC16

The AryCRC16 instruction calculates the CRC-16 value using the MODBUS method.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| AryCRC16 | Calculate Array CRC-16 | FUN |  | Out:=AryCRC16(In, Size, Initial, OutOrder); |

## Variables

| Name | Meaning | 1/0 | Description | Valid range | Unit | Default |

| OutOrder | Refer to Function for the enumerators for the enumerated type _eBYTE_ORDER. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The AryCRC16 instruction calculates the CRC-16 value of Size array elements of array to process In[] starting from $\operatorname{In}[0]$. The MODBUS method is used.
Set Initial to the initial value for CRC-16 value calculation. OutOrder specifies the byte order.

The data type of OutOrder is enumerated type _eBYTE_ORDER. The meaning of the enumerators are as follows:

| Enumerator | Meaning |
| :---: | :---: |
| _LOW_HIGH | Lower byte first, upper byte last |
| _HIGH_LOW | Upper byte first, lower byte last |

The following example is for when Size is UINT\#2, Initial is WORD\#16\#FFFF and OutOrder is _LOW_HIGH.

LD

## ST

def:=AryCRC16(abc[4], UINT\#2, WORD\#16\#FFFF, _LOW_HIGH);

## Precautions for Correct Use

- If the value of Size is 0 , the value of Out is WORD\#16\#0.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of OutOrder is outside of the valid range.
- The value of Size exceeds the array area of In[].
- An array without a subscript is passed to $\operatorname{In}[]$.
- The elements in In[] are not bit string, integer, real number, time, duration, date, or date and time data.

2 Instruction Descriptions

## Text String Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |
| CONCAT | Concatenate String | $2-520$ |
| LEFT and RIGHT | Get String Left/Get String Right | $2-522$ |
| MID | Get String Any | $2-524$ |
| FIND | Find String | $2-526$ |
| LEN | String Length | $2-528$ |
| REPLACE | Replace String | $2-529$ |
| DELETE | Delete String | $2-531$ |
| INSERT | Insert String | $2-533$ |
| GetByteLen | Get Byte Length | $2-535$ |
| ClearString | Clear String | $2-537$ |
| ToUCase and ToLCase | Convert to Uppercase/ <br> Convert to Lowercase |  |
| TrimL and TrimR | Trim String Left/Trim String Right | $2-538$ |

## CONCAT

The CONCAT instruction joins two to five text strings．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CONCAT | Concatenate String | FUN |  | Out：＝CONCAT（In1，$\cdots, \operatorname{lnN})$ ； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In1 to InN | Strings to <br> join | Input | Text strings to join，where N <br> is 2 to 5 | Depends on data type． | --- | ＂＊ |
| Out | Result of <br> joining | Output | Text string that resulted from <br> joining | Depends on data type． | --- | --- |

＊If you omit the input parameter that connects to $\operatorname{In} N$ ，the default value is not applied，and a building error will occur．For example，if N is 3 and the input parameters that connect to $\operatorname{In} 1$ and $\operatorname{In} 2$ are omitted，the default values are applied，but if the input parameter that connects to $\operatorname{In} 3$ is omitted，a building error will occur．

|  |  |  | t s | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | me | dur |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 罟 | $\begin{aligned} & \text { ロ } \\ & \underset{\sim}{n} \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { § } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { 召 } \end{aligned}$ | ${\underset{Z}{2}}_{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ |  | $\frac{\mathrm{C}}{\underset{Z}{\mathrm{C}}}$ | $\underset{-1}{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 윽 }}{ }$ | $\sum_{-1}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{2} \end{aligned}$ | $$ | $\begin{aligned} & \frac{-1}{3} \\ & \frac{3}{n} \end{aligned}$ | $\begin{aligned} & \text { 号 } \\ & \text { m } \end{aligned}$ | 음 | 먹 | 0 式 2 0 |
| In1 to $\operatorname{lnN}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The CONCAT instruction joins 2 to 5 text strings in strings to join $\operatorname{In} 1$ to $\operatorname{InN}$ in that order．It adds a NULL character to the end．
The following example is for when $\operatorname{In} 1$ is＇$A B$＇，In2 is＇$C$＇and $\operatorname{In} 3$ is＇$D E F$＇．The value of variable $a b c$ will be＇ABCDEF＇．

In1
'AB'
In2 $\quad$ ' C ' $\xrightarrow{\text { Joined. }}$ Out=abc 'ABCDEF'

In3
'DEF'

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- One of In1 to $\operatorname{InN}$ does not end in a NULL character.
- The length of the joined character strings exceeds the size of Out.

## LEFT and RIGHT

These instructions extract a text string with the specified number of characters．
LEFT：Extracts characters from the left（beginning）of the text string．
RIGHT：Extracts characters from the right（end）of the text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| LEFT | Get String Left | FUN |  | Out：＝LEFT（In，L）； |
| RIGHT | Get String Right | FUN |  | Out：＝RIGHT（In，L）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Source string | Input | Text string from which to extract characters | Depends on data type． | －－－ | ＂ |
| L | Number of characters |  | Number of characters to extract | 0 to 1985 |  | 1 |
| Out | Extraction result | Output | Extracted text string | Depends on data type． | －－－ | －－－ |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O | $\begin{aligned} & \text { ロ } \\ & \text { 구N } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { O} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{\mathbf{N}}}_{\substack{C}}$ | $\underset{\substack{C}}{\substack{C}}$ | $\frac{\text { 든 }}{\underset{1}{2}}$ | $\underset{\underset{i}{C}}{\underset{1}{C}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 즉 }}{ }$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { J } \\ & \stackrel{\pi}{2} \end{aligned}$ |  | $\stackrel{-1}{\overline{3}}$ | 号 | 음 | 먹 | 込 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| L |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

These instructions extract a text string with the number of characters specified by number of characters $L$ from the source string In．A NULL character is placed at the end of extraction result Out．

## －LEFT

Extracts characters from the left（beginning）of In．

The following example is for when $I n$ is 'ABCDEF' and $L$ is UINT\#3. The value of variable abc will be 'ABC'.

## - RIGHT

Extracts characters from the right (end) of In.
The following example is for when $I n$ is 'ABCDEF' and $L$ is UINT\#3. The value of variable $a b c$ will be 'DEF'.

LD

'ABCDEF'

ST
abc:=RIGHT('ABCDEF', UINT\#3); Three characters extracted from the right.

Out=abc $\square$

## Precautions for Correct Use

- If the value of $L$ is larger than the number of characters in In or it is within the valid range, an error does not occur and all of the characters in In are copied to Out.
- If the value of $L$ is 0 , an error does not occur and only the NULL character is assigned to Out.
- Multi-byte characters are counted as one character each.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In does not end in a NULL character.
- In results in a character code error.
- The execution result exceeds the size of Out.

## MID

The MID instruction extracts a text string with the specified number of characters from the specified character position．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MID | Get String Any | FUN |  | Out：＝MID（In，L，P）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Source string | Input | Text string from which to extract characters | Depends on data type． | －－－ | ＂ |
| L | Number of characters |  | Number of characters to extract | 0 to 1985 |  | 1 |
| P | First char－ acter |  | First character to extract | 1 to 1985 |  |  |
| Out | Extraction result | Output | Extracted text string | Depends on data type． | －－－ | －－－ |

|  | 0 <br> 0 <br> $\frac{0}{\square}$ <br> $\stackrel{0}{3}$ |  | S | ngs |  |  |  |  |  | ers |  |  |  |  |  |  | me | dur | ion | gs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O | $\begin{aligned} & \text { 品 } \\ & \text { In } \end{aligned}$ | § O O | 0 $\sum_{0}^{0}$ D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\underset{\underset{1}{\infty}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{ㄷ ㅡ ㄹ ~}{n}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\sum_{-1}^{\infty}$ | $\bar{z}_{1}$ | ${\underset{N}{1}}_{0}$ | $\overline{2}_{-1}$ | $$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \hline \end{aligned}$ | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 号 } \\ & \text { m } \end{aligned}$ | 움 | 억 | 第 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| L |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| P |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The MID instruction extracts a text string with the number of characters specified by number of charac－ ters $L$ from the source string $I n$ ．The first character to extract is specified by first character $P$ ．A NULL character is placed at the end of extraction result Out．

The following example is for when $I n$ is 'ABCDEF', $L$ is UINT\#3, and $P$ is UINT\#2. The value of variable $a b c$ will be 'BCD'.

## Precautions for Correct Use

- If the value of $L$ is 0 , an error does not occur and only the NULL character is assigned to Out.
- Multi-byte characters are counted as one character each.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In does not end in a NULL character.
- In results in a character code error.
- In does not have enough characters for the number of characters specified by $L$ from the position specified by $P$.
- The value of $P$ is 0 .
- The execution result exceeds the size of Out.

## FIND

The FIND instruction searches a specified text string for the position of a specified text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| FIND | Find String | FUN |  | Out：＝FIND（ln1，In2）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | String to search | Input | Text string to search | Depends on data type． | －－－ | ＂ |
| In2 | Search key |  | Text string to search for |  |  |  |
| Out | Search result | Output | Search result | 0 to 1985 | －－－ | －－－ |

|  |  |  | Bit | ings |  |  |  |  | Integ |  |  |  |  |  |  |  | $\begin{aligned} & \text { imes, } \\ & \text { se }, ~ \end{aligned}$ | dure d tex |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | \％ | $\underset{\text { m }}{\substack{\text { m }}}$ | $\begin{aligned} & \sum \\ & \text { 另 } \end{aligned}$ | $\begin{aligned} & \text { D } \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \hline \sum_{0} \\ & 0 \\ & \text { D } \end{aligned}$ |  | $\sum_{\substack{c}}^{C}$ | $\underset{\sum_{1}}{\text { C }}$ | $\sum_{\underset{1}{c}}^{\substack{c}}$ | $\sum_{-1}^{\infty}$ | $\overline{\text { z＿1 }}$ | $\underset{\lambda}{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{N}{2} \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \text { N } \\ & \end{aligned}$ | $\frac{-1}{\overline{3}}$ | $\begin{aligned} & \text { 另 } \\ & \text { 翤 } \end{aligned}$ | 음 | 막 |  |
| In1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The FIND instruction searches for search key $\operatorname{In} 2$ in string to search $\operatorname{In} 1$ ．The position of $\operatorname{In} 2$ from the start of $\ln 1$ is assigned to search result Out．If $\operatorname{In} 2$ is not found in $\operatorname{In} 1$ ，Out is 0 ．
The following example is for when $\operatorname{In} 1$ is＇ABCDEF＇and In2 is＇CD＇．The value of variable abc will be UINT\＃3．

## Precautions for Correct Use

- Make sure the number of characters in In2 is less than the number of characters in $\operatorname{In} 1$. Otherwise, the value of Out will be 0 .
- If $\operatorname{In} 2$ exists more than once in $\operatorname{In} 1$, the position of the first $\ln 2$ from the beginning of $\ln 1$ is assigned to Out.
- If the value of $\ln 1$ and $\operatorname{In} 2$ is only the NULL character, the value of Out is 1 .
- Multi-byte characters are counted as one character each.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In1 or In2 does not end in a NULL character.
- In1 or In2 results in a character code error.

## LEN

The LEN instruction finds the number of characters in a text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| LEN | String Length | FUN | $\begin{aligned} & \begin{array}{l} (@) L E N \\ \\ - \\ -\operatorname{InN} \end{array} \quad \text { ENO } \end{aligned}$ | Out：＝LEN（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Length <br> string | Input | Text string to find length | Depends on data type． | --- | $"$ |
| Out | Find result | Output | Length detection result | 0 to 1985 | --- | --- |

|  |  |  | Bit | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | me | dur | ion | gs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 䍐 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { O } \end{aligned}$ | $\underset{\underset{Z}{\infty}}{\substack{C}}$ | $\underset{\underset{1}{C}}{\bar{C}}$ | $\frac{\text { 들 }}{0}$ | $\frac{\mathrm{C}}{\sum_{1}}$ | $\sum_{-1}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\bar{Z}_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \stackrel{\pi}{2} \end{aligned}$ |  | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 号 } \\ & \end{aligned}$ | 응 | 먹 | 足 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The LEN instruction finds the number of characters in length string In．A NULL character at the end of In is not counted．
The following example is for when In is＇ABCDEF＇．The value of variable abc will be UINT\＃6．

LD

ST
$a b c:=L E N($（＇ABCDEF＇）；
In ＇ABCDEF＇$\xrightarrow{\text { Number of characters }}$ Out＝abc UINT\＃6

## Precautions for Correct Use

－Multi－byte characters are counted as one character each．
－An error occurs in the following cases．ENO will be FALSE，and Out will not change．
－In does not end in a NULL character．
－In results in a character code error．

## REPLACE

The REPLACE instruction replaces part of a text string with another text string.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| REPLACE | Replace String | FUN |  | ```Out:=REPLACE(In1, In2, L, P);``` |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | String for replacement | Input | Text string for replacement | Depends on data type. | --- | " |
| In2 | Insert string |  | Text string to insert |  |  |  |
| L | Number of characters |  | Number of characters to delete | 0 to 1985 |  | 1 |
| P | Replacement start position |  | Replacement start position | 1 to 1985 |  |  |
| Out | Replacement result | Output | Text string after replacement | Depends on data type. | --- | --- |

|  | $\begin{aligned} & \text { © } \\ & \frac{0}{0} \\ & \stackrel{0}{0} \end{aligned}$ |  | s | ngs |  |  |  |  | Inte |  |  |  |  |  |  |  | nes | dur |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { D } \\ & \text { 구N } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | K O D D | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\underset{-1}{C}}{\substack{C}}$ | $\frac{\text { 득 }}{\frac{1}{2}}$ | $\frac{C}{\underset{Z}{E}}$ | ${\underset{\sim}{2}}_{\infty}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\text { 은 }}{ }$ | $\sum_{-1}^{\Gamma}$ | $$ | $$ | $\frac{-1}{3}$ | $\begin{aligned} & \text { 号 } \\ & \text { m } \end{aligned}$ | 응 | 먹 | 嵒 |
| In1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| L |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| P |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The REPLACE instruction replaces part of string for replacement $\ln 1$ with string to insert In2. First the number of characters specified by $L$ from the position specified by $P$ are deleted from $\ln 1$. In2 is then inserted for the deleted characters. A NULL character is placed at the end of replacement result Out.

The following example is for when $\operatorname{In} 1$ is 'ABCDEF', In2 is 'GHI', $P$ is UINT\#2, and $L$ is UINT\#4. The value of variable $a b c$ will be 'AGHIF'.

## Precautions for Correct Use

- If $L$ is 0 , an error will not occur and all of the characters in $\operatorname{In} 1$ are inserted to Out.
- If the value of $\operatorname{In} 2$ is $0, L$ characters are deleted from $P$ in $\operatorname{In} 1$.
- Multi-byte characters are counted as one character each.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In1 or In2 does not end in a NULL character.
- In1 results in a character code error.
- In1 does not have enough characters for the number of characters specified by $L$ from the position specified by $P$.
- The value of $P$ is 0 .
- The length of the replacement result exceeds the size of Out.

## DELETE

The DELETE instruction deletes all or part of a text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DELETE | Delete String | FUN |  | Out：＝DELETE（In，L，P）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | String for deletion | Input | Text string for deletion | Depends on data type． | －－－ | ＂ |
| L | Number of characters |  | Number of characters to delete | 0 to 1985 |  | 1 |
| P | Deletion start position |  | Deletion start position | 1 to 1985 |  |  |
| Out | Deletion result | Output | Text string after deletion | Depends on data type． | －－－ | －－－ |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 置 } \\ & \text { ? } \end{aligned}$ |  | $\begin{aligned} & \sum \\ & \text { § } \\ & \text { D } \end{aligned}$ | 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\frac{C}{\underset{Z}{\mathbf{C}}}$ | $\underset{\underset{-1}{C}}{\substack{C}}$ | $\frac{\mathrm{O}}{\underset{Z}{\mathrm{Z}}}$ | $\frac{\underset{i}{C}}{\underset{i}{c}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{Z}{2}}_{\square}^{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\frac{\text { 글 }}{\overline{1}}$ | $\begin{aligned} & \text { 号 } \\ & \text { 鬲 } \end{aligned}$ | 금 | 막 | 0 -1 0 0 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| L |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| P |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The DELETE string deletes the number of characters specified by $L$ from the position specified by $P$ from In．A NULL character is placed at the end of deletion result Out．

The following example is for when $I n$ is 'ABCDEF', $L$ is UINT\#4, and $P$ is UINT\#2. The value of variable $a b c$ will be 'AF'.

## Precautions for Correct Use

- If $L$ is 0 , an error will not occur and all of the characters in In are inserted to Out.
- Multi-byte characters are counted as one character each.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In does not end in a NULL character.
- In results in a character code error.
- In does not have enough characters for the number of characters specified by $L$ from the position specified by $P$.
- The value of $P$ is 0 .
- The execution result exceeds the size of Out.

## INSERT

The INSERT instruction inserts a text string into another text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| INSERT | Insert String | FUN |  | Out：＝INSERT（In1，In2，P）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Original string | Input | Text string into which to insert string | Depends on data type． | －－－ | ＂ |
| In2 | Insert string |  | Text string to insert |  |  |  |
| P | Insertion start posi－ tion |  | Insertion start position | 0 to 1985 |  | 0 |
| Out | Insertion result | Output | Text string after insertion | Depends on data type． | －－－ | －－－ |

|  |  |  | it s | ings |  |  |  |  | Inte | ers |  |  |  |  |  |  |  | dur |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { ロ } \\ & \text { 궁 } \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { O } \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \Gamma \\ & \sum_{0} \\ & \text { D } \end{aligned}$ | ${\underset{\sim}{1}}_{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{\mathrm{O}}{\underset{Z}{\mathrm{Z}}}$ | $\underset{-1}{\mathrm{C}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\sum_{i=1}^{0}$ | $\sum_{-1}^{r}$ | $$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \end{aligned}$ | $\stackrel{-1}{\overline{3}}$ | $\begin{aligned} & \text { 号 } \\ & \text { 翤 } \end{aligned}$ | 음 | 먹 |  |
| In1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| P |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

The INSERT instruction inserts insertion string $\operatorname{In} 2$ into original string $\operatorname{In} 1$ at insertion start position $P$ ．A NULL character is placed at the end of insertion result Out．

The following example is for when $\operatorname{In} 1$ is 'ABCD', In2 is 'GHI', and $P$ is UINT\#2. The value of variable $a b c$ will be 'ABGHICD'.

LD

In1

Insert
In2

```
    'GHI'
```

## Additional Information

If $P$ is $0, \ln 1$ is inserted at the end of $\ln 2$.

## Precautions for Correct Use

- Multi-byte characters are counted as one character each.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In1 or In2 does not end in a NULL character.
- In1 results in a character code error.
- The value of $P$ is greater than the number of characters in $\operatorname{In} 1$.
- The length of the insertion result exceeds the size of Out.

## GetByteLen

The GetByteLen instruction counts the number of bytes in a text string.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GetByteLen | Get Byte Length | FUN |  (@)GetByteLen <br>  <br> -EN <br> In | Out:=GetByteLen(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Count <br> string | Input | Text string to count number <br> of bytes | Depends on data type. | --- | " |
| Out | Number of <br> bytes | Output | Number of bytes | 0 to 1985 | Bytes | --- |

## Function

The GetByteLen instruction counts the number of bytes in count string In. A NULL character at the end of the text string is not counted.
The following example is for when $I n$ is 'ABCDEF'. The value of variable $a b c$ will be 6.

LD
ST
$\mathrm{abc}:=$ GetByteLen('ABCDEF');

In $\qquad$ Number of bytes Out=abc $\square$

## Additional Information

If In contains only ASCII characters, the result will be the same as the result of the LEN instruction.

## Precautions for Correct Use

An error occurs in the following case. ENO will be FALSE, and Out will not change.

- In does not end in a NULL character.

## ClearString

The ClearString instruction clears a text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ClearString | Clear String | FUN |  | ClearString（InOut）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| InOut | Clear string | In－out | Text string to clear | Depends on data type． | --- | --- |
| Out | Return <br> value | Output | Always TRUE | TRUE only | --- | --- |

|  |  |  | s | ings |  |  |  |  | Inte |  |  |  |  |  |  |  |  | dur | ion | gs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { ロ } \\ & \text { 궁 } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | D O D D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & 0 \\ & 0 \end{aligned}$ | $\frac{C}{\sum_{-1}^{c}}$ | $\underset{\substack{C}}{C}$ |  | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{Z}{2}}_{\substack{2}}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \frac{\pi}{\pi} \\ & \stackrel{\pi}{r} \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \text { R } \end{aligned}$ | $\frac{-1}{1}$ | 号 | 긍 | 먹 | 0 0 0 0 0 |
| InOut |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The ClearString instruction clears clear string InOut．NULL characters are stored in the entire range of InOut．
The following figure shows a programming example．The content of STRING variable will be all NULL characters．

LD

ST

ClearString（abc）；

## Precautions for Correct Use

Return value Out is not used when the instruction is used in ST．

## ToUCase and ToLCase

ToUCase: Converts all single-byte letters in a text string to uppercase.
ToLCase: Converts all single-byte letters in a text string to lowercase.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ToUCase | Convert to Uppercase | FUN |  | Out:=ToUCase(In); |
| ToLCase | Convert to Lowercase | FUN |  | Out:=ToLCase(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Data to <br> convert | Input | Text string to convert | Depends on data type. | --- | " |
| Out | Conver- <br> sion result | Output | Converted text string | Depends on data type. | --- | --- |

|  | O 0 $\frac{0}{0}$ O On |  | it | ings |  |  |  |  |  |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \mathrm{a} \end{aligned}$ | $\begin{aligned} & \text { dur: } \\ & \text { d tex } \end{aligned}$ | $\begin{aligned} & \text { tion } \\ & \text { stri } \end{aligned}$ | gs |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \text { 品 } \\ & \text { 而 } \end{aligned}$ | $\sum$ O D | $\begin{aligned} & \sum_{0}^{0} \\ & \text { D } \end{aligned}$ | K O D | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{\text { 득ㄱㄱㄴ }}{}$ | $\frac{C}{\underset{i}{C}}$ | ${\underset{-1}{\infty}}_{\substack{\infty}}$ | $\bar{Z}_{1}$ | 은 | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{\mathbb{2}} \end{aligned}$ |  | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 목 } \\ & \hline 7 \end{aligned}$ | -1 | 머 | - |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

## - ToUCase

The ToUCase instruction converts all single-byte letters in data to convert In to uppercase.

## - ToLCase

The ToLCase instruction converts all single-byte letters in data to convert In to lowercase.
Both instructions output a NULL character at the end of the text string. Only single-byte characters are changed.

The following example for the ToUCase instruction is for when In is 'xyz'. The value of variable abc will be ' $X Y Z$ '.
LD

ST
abc:=ToUCase('xyz');

## Precautions for Correct Use

- Two-byte letters are not converted.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- In does not end in a NULL character.
- In results in a character code error.
- The conversion result exceeds the size of Out.

## TrimL and TrimR

TrimL：Removes blank space from the beginning of a text string．
TrimR：Removes blank space from the end of a text string．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TrimL | Trim String Left | FUN |  | Out：＝TrimL（In）； |
| TrimR | Trim String Right | FUN |  | Out：＝TrimR（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | String to <br> trim | Input | Text string to trim | Depends on data type． | --- | $"$ |
| Out | Trimming <br> result | Output | Text string after trimming | Depends on data type． | --- | --- |

|  | $\begin{aligned} & \text { © } \\ & \text { o } \\ & \underline{0} \\ & \text { O/ } \end{aligned}$ |  | Bit | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \mathrm{a} \end{aligned}$ | $\begin{aligned} & \text { dur } \\ & \text { d te } \end{aligned}$ | str |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 䍙 | $\begin{aligned} & \text { ロ } \\ & \underset{\sim}{\boldsymbol{m}} \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & 0 \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & 0_{0}^{0} \end{aligned}$ | $\underset{\underset{Z}{\infty}}{\substack{C}}$ | $\underset{\substack{C}}{\substack{c}}$ | $\underset{-1}{\text { 들 }}$ | $\frac{\mathrm{C}}{\underset{i}{\mathrm{C}}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 윽 }}{ }$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { D } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \text { I } \end{aligned}$ | $\stackrel{-1}{3}$ | 号 | 금 | 먹 |  |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |

## Function

## －TrimL

The TrimL instruction deletes blank characters from the beginning of string to trim In．If there are no blank characters at the beginning of the text string，nothing is done．

## －TrimR

The TrimR instruction deletes blank characters from the end of string to trim In．If there are no blank characters at the end of the text string，nothing is done．
Both instructions output a NULL character at the end of the text string．Both ASCII spaces（16\＃20）and two－byte Japanese spaces（16\＃E38080）are treated as blank characters．

The following example for the TrimL instruction is for when $I n$ is ' $A B \quad C$ '. The value of variable $a b c$ will be " $A B C$ '.

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- In does not end in a NULL character.
- In results in a character code error.
- The conversion result exceeds the size of Out.

2 Instruction Descriptions

## Time and Time of Day Instructions

| Instruction | Name | Page | Instruction | Name | Page |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ADD_TIME | Add Time | 2-544 | DateToSec | Convert Date to Seconds | 2-576 |
| ADD_TOD_TIME | Add Time to Time of Day | 2-546 | TodToSec | Convert Time of Day to Seconds | 2-577 |
| ADD_DT_TIME | Add Time to Date and Time | 2-548 | SecToDt | Convert Seconds to Date and Time | 2-578 |
| SUB_TIME | Subtract Time | 2-550 | SecToDate | Convert Seconds to Date | 2-580 |
| SUB_TOD_TIME | Subtract Time from Time of Day | 2-552 | SecToTod | Convert Seconds to Time of Day | 2-582 |
| SUB_TOD_TOD | Subtract Time of Day | 2-554 | TimeToNanoSec | Convert Time to Nanoseconds | 2-583 |
| SUB_DATE_DATE | Subtract Date | 2-555 | TimeToSec | Convert Time to Seconds | 2-584 |
| SUB_DT_DT | Subtract Date and Time | 2-556 | NanoSecToTime | Convert Nanoseconds to Time | 2-585 |
| SUB_DT_TIME | Subtract Time from Date and Time | 2-558 | SecToTime | Convert Seconds to Time | 2-586 |
| MULTIME | Multiply Time | 2-560 | ChkLeapYear | Check for Leap Year | 2-588 |
| DIVTIME | Divide Time | 2-562 | GetDaysOfMonth | Get Days in Month | 2-589 |
| CONCAT_DATE_TOD | Concatenate Date and Time of Day | 2-564 | DaysToMonth | Convert Days to Month | 2-591 |
| DT_TO_TOD | Extract Time of Day from Date and Time | 2-566 | GetDayOfWeek | Get Day of Week | 2-593 |
| DT_TO_DATE | Extract Date from Date and Time | 2-568 | GetWeekOfYear | Get Week Number | 2-595 |
| SetTime | Set Time | 2-570 | DtToDateStruct | Break Down Date and Time | 2-597 |
| GetTime | Get Time of Day | 2-572 | DateStructToDt | Join Time | 2-599 |
| DtToSec | Convert Date and Time to Seconds | 2-574 |  |  |  |

## ADD＿TIME

The ADD＿TIME instruction adds two times．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ADD＿TIME | Add Time | FUN |  | Out：＝ADD＿TIME（ln1，In2）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Add time 1 | Input | Add time 1 | Depends on data type． | ns | T\＃0s |
| In2 | Add time 2 |  | Add time 2 |  |  |  |
| Out | Total time | Output | Total time | Depends on data type． | ns | －－－ |

|  | O 0 $\frac{0}{0}$ | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O | $\begin{aligned} & \text { ロ } \\ & \text { 군 } \end{aligned}$ | $\sum$ § D | 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\sum_{-1}^{C}$ |  |  | $\underset{\underset{1}{\mathrm{C}}}{\stackrel{C}{2}}$ | $\underset{-1}{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 윽 }}{ }$ | $\sum_{-1}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $$ | $\begin{aligned} & \frac{-1}{\overline{3}} \\ & \hline 1 \end{aligned}$ | $\begin{aligned} & \text { 只 } \\ & \hline 1 \end{aligned}$ | 음 | 막 | 足 |
| In1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |
| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |

## Function

The ADD＿TIME instruction adds two times，In1 and In2．The result of addition in Out is also a time． The following example is for when $\operatorname{In} 1$ is $\mathrm{T} \# 1 \mathrm{~d} 2 \mathrm{~h} 3 \mathrm{~m} 4 \mathrm{~s}$ and $\operatorname{In} 2$ is $\mathrm{T} \# 5 \mathrm{~d} 6 \mathrm{~h} 7 \mathrm{~m} 8 \mathrm{~s}$ ．
LD ST
 abc：＝ADD＿TIME（T\＃1d2h3m4s，T\＃5d6h7m8s）；

## Precautions for Correct Use

An error will not occur even if the addition result exceeds the valid range of Out.

- T\#106751d_23h_47m_16s_854.775807ms + T\#0.000001ms $\rightarrow$ T\#-106751d_23h_47m_16s_854.775808ms
- T\#-106751d_23h_47m_16s_854.775808ms + T\#-0.000001ms $\rightarrow$ T\#106751d_23h_47m_16s_854.775807ms

## ADD_TOD_TIME

The ADD_TOD_TIME instruction adds a time to a time of day.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ADD_TOD_TIME | Add Time to Time of Day | FUN |  | Out:=ADD_TOD_TIME(In1, In2); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Add time of day | Input | Add time of day | Depends on data type. | Hour, minutes, seconds | $\begin{array}{\|l} \hline \text { TOD\#0:0 } \\ : 0 \end{array}$ |
| In2 | Add time |  | Add time |  | ns | T\#0s |
| Out | Resulting time of day | Output | Resulting time of day | Depends on data type. | Hour, minutes, seconds | --- |

## Function

The ADD_TOD_TIME instruction adds a time, In2, to a time of day In1. The result of addition in Out is also a time of day.
The following example is for when $\operatorname{In} 1$ is TOD\#23:59:59.999999999 and $\operatorname{In} 2$ is T\#1d0h0m0.000000001s.

## Precautions for Correct Use

An error will not occur even if the addition result exceeds the valid range of Out.

- TOD\#23:59:59.999999999 + T\#0.000001ms $\rightarrow$ TOD\#0:0:0.000000000
- TOD\#0:0:0.000000000 + T\#-0.000001ms $\rightarrow$ TOD\#23:59:59.999999999

## ADD_DT_TIME

The ADD_DT_TIME instruction adds a time to a date and time.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ADD_DT_TIME | Add Time to Date and Time | FUN |  | Out:=ADD_DT_TIME(In1, In2); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Add date and time | Input | Add date and time | Depends on data type. | Year, month, day, hour, minutes, seconds | $\begin{aligned} & \hline \text { DT\#197 } \\ & 0-1-1- \\ & 0: 0: 0 \end{aligned}$ |
| In2 | Add time |  | Add time |  | ns | T\#0s |
| Out | Addition result date and time | Output | Addition result date and time | Depends on data type. | Year, month, day, hour, minutes, seconds | --- |

## Function

The ADD_DT_TIME instruction adds a time, In2, to a date and time In1. The result of addition in Out is also a date and time. Leap years are also accounted for. The following example is for when $\ln 1$ is DT\#1970-1-1-0:0:0 and In2 is T\#1d.

ST
abc:=ADD_DT_TIME(DT\#1970-1-1-0:0:0, T\#1d);

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Precautions for Correct Use

An error will not occur even if the addition result exceeds the valid range of Out.

- DT\#2554-7-21-23:34:33.709551615 + T\#0.000001ms $\rightarrow$ DT\#1970-1-1-0:0:0
- DT\#1970-1-1-0:0:0 + T\#-0.000001ms $\rightarrow$ DT\#2554-7-21-23:34:33.709551615

## SUB＿TIME

The SUB＿TIME instruction subtracts one time from another．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SUB＿TIME | Subtract Time | FUN |  | Out：＝SUB＿TIME（In1，In2）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Original time | Input | Original time | Depends on data type． | ns | T\＃0s |
| In2 | Time to subtract |  | Time to subtract |  |  |  |
| Out | Resulting time | Output | Resulting time | Depends on data type． | ns | －－－ |

| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |

## Function

The SUB＿TIME instruction subtracts a time In2 from another time In1．The result of subtraction in Out is also a time．
The following example is for when $\ln 1$ and $\operatorname{In} 2$ are T\＃1d．

LD

abc:=SUB_TIME(T\#1d, T\#1d);

## Precautions for Correct Use

An error will not occur even if the subtraction result exceeds the valid range of Out.

- T\#106751d_23h_47m_16s_854.775807ms - T\#-0.000001ms $\rightarrow$ T\#-106751d_23h_47m_16s_854.775808ms
- T\#-106751d_23h_47m_16s_854.775808ms - T\#0.000001ms $\rightarrow$ T\#106751d_23h_47m_16s_854.775807ms

## SUB＿TOD＿TIME

The SUB＿TOD＿TIME instruction subtracts a time from a time of day．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SUB＿TOD＿TIME | Subtract Time from Time of Day | FUN |  | Out：＝SUB＿TOD＿TIME（In1， In2）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\ln 1$ | Time of day | Input | Time of day | Depends on data type． | Hour，min－ utes，seconds | $\begin{array}{\|l} \hline \text { TOD\#0:0 } \\ : 0 \end{array}$ |
| In2 | Time to subtract |  | Time to subtract |  | ns | T\＃0s |
| Out | Resulting time of day | Output | Resulting time of day | Depends on data type． | Hour，min－ utes，seconds | －－－ |

|  |  |  | Bit s | rings |  |  |  |  |  |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes, } \\ & \text { s. } \end{aligned}$ | dur dex |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O | $\underset{\text { m }}{\underset{\sim}{m}}$ | $\begin{aligned} & \sum \\ & \text { 另 } \end{aligned}$ | $\begin{array}{\|l} \hline 0 \\ \sum_{0} \\ \text { 另 } \end{array}$ | $\begin{aligned} & \text { 듬 } \\ & \text { D } \\ & \hline 0 \end{aligned}$ | $\underset{\substack{\infty}}{\substack{C}}$ | $\underset{\substack{\mathrm{Z}}}{\substack{0}}$ | $\frac{0}{2}$ | $\underset{\substack{c}}{\substack{c}}$ | $\sum_{-1}^{\infty}$ | $\bar{z}_{1}$ | $\underset{\substack{\mathrm{Z}}}{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \underset{\sim}{\pi} \\ & \stackrel{m}{\gtrless} \end{aligned}$ | $\begin{aligned} & \text { 召 } \\ & \stackrel{刃 i}{~} \end{aligned}$ | $\frac{-1}{3}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 응 | 마 | 号 |
| ln1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |
| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |

## Function

The SUB＿TOD＿TIME instruction subtracts a time In2 from a time of day In1．The result of subtraction in Out is also a time of day．
The following example is for when $\operatorname{In} 1$ is TOD\＃23：59：59 and $\operatorname{In} 2$ is T\＃1s．

LD

## Precautions for Correct Use

An error will not occur even if the subtraction result exceeds the valid range of Out.

- TOD\#23:59:59.999999999 - T\#-0.000001ms $\rightarrow$ TOD\#0:0:0
- TOD\#0:0:0 - T\#0.000001ms $\rightarrow$ TOD\#23:59:59.999999999

## SUB_TOD_TOD

The SUB_TOD_TOD instruction subtracts a time of day from another time of day.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SUB_TOD_TOD | Subtract Time of Day | FUN |  | ```Out:=SUB_TOD_TOD(In1, In2);``` |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Time of day 1 | Input | Time of day 1 | Depends on data type. | Hour, minutes, seconds | $\begin{aligned} & \text { TOD\#0:0 } \\ & : 0 \end{aligned}$ |
| In2 | Time of day 2 |  | Time of day 2 |  |  |  |
| Out | Resulting time | Output | Resulting time | Depends on data type. | ns | --- |

## Function

The SUB_TOD_TOD instruction subtracts time of day In2 from time of day In1. The result of subtraction in Out is a time.
The following example is for when In1 is TOD\#23:59:59.999999999 and In2 is
TOD\#23:59:50.000000000.

LD

ST
abc:=SUB_TOD_TOD(TOD\#23:59:59.999999999,
TOD\#23:59:50.000000000);

## SUB＿DATE＿DATE

The SUB＿DATE＿DATE instruction subtracts another date from another date．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SUB＿DATE＿DATE | Subtract Date | FUN |  （＠）SUB＿DATE＿DATE <br>  <br> $=$ <br> $\ln 1$ <br> $\ln 2$ <br> $\ln 2$ ENO | Out：＝SUB＿DATE＿DATE（In1， In2）； |

Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Date 1 | Input | Date 1 | Depends on data type． | Year，month， day | $\begin{aligned} & \text { D\#1970- } \\ & 1-1 \end{aligned}$ |
| In2 | Date 2 |  | Date 2 |  |  |  |
| Out | Resulting time | Output | Resulting time | Depends on data type． | ns | －－－ |

|  |  |  | Bit | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { imes } \\ & \text { es, ar } \end{aligned}$ | $\begin{aligned} & \text { dur } \\ & \text { d te } \end{aligned}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { 四 } \\ & \text { 而 } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & 0 \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & 0 \\ & 0 \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\substack{C}}{\substack{c}}$ | ${ }_{i}^{\text {들 }}$ | $\frac{\mathrm{C}}{\underset{i}{\mathrm{E}}}$ | $\underset{-1}{\infty}$ | $\bar{Z}_{1}$ | $\sum_{i=1}^{0}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \pi \\ & \stackrel{\pi}{2} \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\stackrel{-1}{\overline{1}}$ | $\begin{aligned} & \frac{8}{8} \\ & \frac{1}{m} \end{aligned}$ | －1 | 윽 | 号 |
| In1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |
| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |

## Function

The SUB＿DATE＿DATE instruction subtracts date $\operatorname{In} 2$ from date $\ln 1$ ．The result of subtraction in Out is a time．
The following example is for when $\operatorname{In} 1$ is D\＃1970－1－7 and $\operatorname{In} 2$ is D\＃1970－1－2．
LD

ST
abc：＝SUB＿DATE＿DATE（D\＃1970－1－7，D\＃1970－1－2）；

## SUB＿DT＿DT

The SUB＿DT＿DT instruction subtracts another date and time from another date and time．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SUB＿DT＿DT | Subtract Date and Time | FUN |  | Out：＝SUB＿DT＿DT（In1， In2）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Date and time 1 | Input | Date and time 1 | Depends on data type． | Year，month， day，hour， minutes，sec－ onds | $\begin{aligned} & \text { DT\#197 } \\ & 0-1-1- \\ & 0: 0: 0 \end{aligned}$ |
| In2 | Date and time 2 |  | Date and time 2 |  |  |  |
| Out | Resulting time | Output | Resulting time | Depends on data type． | ns | －－－ |

|  |  |  | t | ings |  |  |  |  |  |  |  |  |  |  |  |  | me | dur | tion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 罟 | $\begin{aligned} & \text { 四 } \\ & \text { m } \end{aligned}$ | $\sum$ O O | O O D | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | ${\underset{Z}{1}}_{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | ${ }_{\frac{0}{2}}^{\text {득 }}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | ${\underset{-1}{\infty}}_{\infty}^{\infty}$ | $\sum_{1}$ | $\underset{\text { 은 }}{ }$ | $\sum_{i}^{5}$ | $\begin{aligned} & \text { D } \\ & \text { m } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\frac{-1}{\overline{1}}$ | 号 | 금 | 먹 | 号 |
| In1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |
| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |

## Function

The SUB＿DT＿DT instruction subtracts date and time In2 from date and time In1．The result of subtrac－ tion in Out is a time．
The following example is for when $\operatorname{In} 1$ is DT\＃1970－1－7－0：0：0 and In2 is DT\＃1970－1－2－0：0：0．

LD

|  | $\ln 1$ |
| :--- | :--- |
|  | DT\＃1970－1－7－0：0：0 |
| $-\quad$ | In2 |
|  | DT\＃1970－1－2－0：0：0 |
|  |  |

ST
abc：＝SUB＿DT＿DT（DT\＃1970－1－7－0：0：0，
DT\＃1970－1－2－0：0：0）；

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Precautions for Correct Use

If the processing result exceeds the valid range of Out, Out will contain an illegal value.

## SUB＿DT＿TIME

The SUB＿DT＿TIME instruction subtracts a time from a date and time．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SUB＿DT＿TIME | Subtract Time from Date and Time | FUN |  | Out：＝SUB＿DT＿TIME（In1， In2）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Date and time | Input | Date and time | Depends on data type． | Year，month， day，hour， minutes，sec－ onds | $\begin{aligned} & \hline \text { DT\#197 } \\ & 0-1-1- \\ & 0: 0: 0 \end{aligned}$ |
| In2 | Time to subtract |  | Time to subtract |  | ns | T\＃0s |
| Out | Resulting date and time | Output | Resulting date and time | Depends on data type． | Year，month， day，hour， minutes，sec－ onds | －－－ |

|  |  |  | it s | ings |  |  |  |  |  |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \mathrm{a} \end{aligned}$ | $\begin{aligned} & \text { dur: } \\ & \text { d tex } \end{aligned}$ | $\begin{aligned} & \text { tion } \\ & \text { t stri } \end{aligned}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 買 | $\begin{aligned} & \text { ロ } \\ & \text { 군 } \end{aligned}$ | $\begin{aligned} & \sum \\ & \sum_{0}^{D} \\ & \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { O } \end{aligned}$ | 「 O 号 | $\frac{C}{\sum_{1}^{C}}$ | $\underset{\substack{C}}{\substack{c}}$ | ${ }_{\frac{0}{2}}^{\text {득 }}$ | $\underset{\underset{1}{\mathrm{C}}}{\mathrm{C}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{\Sigma}_{\boldsymbol{i}}$ | ${\underset{Z}{2}}_{\square}^{0}$ | $\sum_{-1}^{r}$ | $\begin{aligned} & \text { D } \\ & \text { 塄 } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \stackrel{\pi}{2} \\ & \stackrel{y}{2} \end{aligned}$ | $\stackrel{-1}{\overline{2}}$ | $\begin{aligned} & \text { 밀 } \\ & \hline 1 \end{aligned}$ | 음 | 먹 | 式 |
| In1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |
| In2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |

## Function

The SUB_DT_TIME instruction subtracts a time $\operatorname{In} 2$ from a date and time $\operatorname{In} 1$. The result of subtraction in Out is a date and time. Leap years are also accounted for.
The following example is for when In1 is DT\#1970-1-1-0:0:0 and In2 is T\#1d.

In1
DT\#1970-1-7-0:0:0

| $-\quad \ln 2$ | T\#1d |
| :--- | :--- |
| Out=abc | DT\#1970-1-6-0:0:0 |

ST
abc:=SUB_DT_TIME(DT\#1970-1-7-0:0:0, T\#1d);

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Precautions for Correct Use

An error will not occur even if the subtraction result exceeds the valid range of Out.

- DT\#2554-7-21-23:34:33.709551615 - T\#-0.000001ms $\rightarrow$ DT\#1970-1-1-0:0:0
- DT\#1970-1-1-0:0:0 - T\#0.000001ms $\rightarrow$ DT\#2554-7-21-23:34:33.709551615

## MULTIME

The MULTIME instruction multiplies a time by a specified number．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| MULTIME | Multiply Time | FUN |  | Out：＝MULTIME（In1，In2）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Original time | Input | Original time | Depends on data type． | ns | T\＃0s |
| In2 | Multiplier |  | Multiplier |  | －－－ | ＊ |
| Out | Resulting time | Output | Resulting time | Depends on data type． | ns | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  |  | Bit | ings |  |  |  |  | Integ | gers |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \text { a } \end{aligned}$ | du |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O O O | $\begin{aligned} & \text { 䍗 } \\ & \hline \end{aligned}$ | $\begin{aligned} & \sum \\ & \text { Z } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \sum_{0}^{0} \\ & 0 \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { OD } \end{aligned}$ |  |  | ${\underset{K}{n}}_{\substack{C}}$ | $\underset{\underset{1}{\mathrm{E}}}{\stackrel{C}{2}}$ | ${\underset{Z 1}{\infty}}_{\infty}^{\infty}$ | ${\underset{J}{1}}$ | $\underset{\sim}{\mathrm{Z}}$ | ${\overline{\underset{\lambda}{1}}}^{\frac{1}{2}}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{1}{2} \end{aligned}$ | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 号 } \\ & \text { n } \end{aligned}$ | 음 | 먹 | O 㞥 ת |
| In1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |
| In2 |  |  |  |  |  | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |

## Function

The MULTIME instruction multiplies a time $\operatorname{In} 1$ by multiplier $\operatorname{In} 2$ ．The result of multiplication in Out is also a time．
The following example is for when $\ln 1$ is T\＃1d2h3m30s and $\ln 2$ is INT\＃2．

LD

## Precautions for Correct Use

- If In2 is a real number, the multiplication result is rounded to the nearest nanosecond. The following table shows how values are rounded.

| Value below <br> nanosec- <br> onds | Treatment | Examples |
| :--- | :--- | :--- |
| Less than 0.5 | The value is truncated. | $1.49 \rightarrow 1$ |
| 0.5 | If the ones digit is an even number, the value is trun- <br> cated. If it is an odd number, the value is rounded up. | $1.50 \rightarrow 2$ <br> $2.50 \rightarrow 2$ |
| Greater than <br> 0.5 | The value is rounded up. | $1.51 \rightarrow 2$ |

- If the value of $\ln 2$ is 0 , positive infinity, negative infinity, or nonnumeric data, the value of Out is as shown below.

| Value of $\operatorname{In} 2$ | Value of Out |
| :--- | :--- |
| 0 | T\#Os |
| $+\infty$ | T\#-106751d23h47m16.854775808s |
| $-\infty$ | T\#-106751d23h47m16.854775808s |
| Nonnumeric <br> data | T\#-106751d23h47m16.854775808s |

- An error will not occur even if the multiplication result exceeds the valid range of Out.
- T\#53375d_23h_53m_38s_427.387904ms * USINT\#2
$\rightarrow$ T\#-106751d_23h_47m_16s_854.775808ms
- T\#-53375d_23h_53m_38s_427.387905ms * USINT\#2 $\rightarrow$ T\#106751d_23h_47m_16s_854.775806ms

## DIVTIME

The DIVTIME instruction divides a time by a specified number.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DIVTIME | Divide Time | FUN |  | Out:=DIVTIME(In1, In2); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Original time | Input | Original time | Depends on data type. | ns | T\#0s |
| In2 | Number to divide by |  | Number to divide by |  | --- | * |
| Out | Resulting time | Output | Resulting time | Depends on data type. | ns | --- |

* If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

The DIVTIME instruction divides a time $\operatorname{In} 1$ by a number $\operatorname{In} 2$. The result of division in Out is also a time. The following example is for when $\operatorname{In} 1$ is T\#1d and $\operatorname{In} 2$ is INT\#2.
LD
ST
abc:=DIVTIME(T\#1d, INT\#2);

## Precautions for Correct Use

- If the value of $\operatorname{In} 2$ is 0 , positive infinity, negative infinity, or nonnumeric data, the value of Out is as shown below.

| Value of In2 | Value of Out |
| :--- | :--- |
| 0 | T\#-106751d23h47m16.854775808s |
| $+\infty$ | T\#0s |
| $-\infty$ | T\#0s |
| Nonnumeric data | Nonnumeric data |

- If In2 is a real number, there may be error of up to several nanoseconds.
- If $\operatorname{In} 2$ is a real number, the division result is rounded to the nearest nanosecond. The following table shows how values are rounded.

| Value below <br> nanoseconds | Description | Example |
| :--- | :--- | :--- |
| Less than 0.5 | The fractional part is truncated. | $1.49 \rightarrow 1$ |
| 0.5 | If the ones digit is an even number, the value is trun- <br> cated. If it is an odd number, the value is rounded up. | $1.50 \rightarrow 2$ <br> $2.50 \rightarrow 2$ |
| Greater than 0.5 | The fractional part is rounded up. | $1.51 \rightarrow 2$ |

- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- In2 is an integer with a value of 0 .

## CONCAT＿DATE＿TOD

The CONCAT＿DATE＿TOD instruction combines a date and a time of day．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \hline \text { CONCAT_DATE } \\ & \text { _TOD } \end{aligned}$ | Concatenate Date and Time of Day | FUN |  | Out：＝CONCAT＿DATE＿TOD （ln1，ln2）； |

## Variables

| Name | Meaning | 1／0 | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In1 | Date | Input | Date | Depends on data type． | Year，month， day | $\begin{array}{\|l} \hline \text { D\#1970- } \\ 1-1 \end{array}$ |
| In2 | Time of day |  | Time of day |  | Hour，min－ utes，seconds | $\begin{aligned} & \text { TOD\#0:0 } \\ & : 0 \end{aligned}$ |
| Out | Combined date and time | Output | Combined date and time | Depends on data type． | Year，month， day，hour， minutes，sec－ onds | －－－ |

|  |  |  | Bit $\mathbf{s}$ | ings |  |  |  |  |  |  |  |  |  |  |  |  | ines, | dura | tions stri |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |

## Function

The CONCAT_DATE_TOD instruction combines a date $\operatorname{In} 1$ and a time of day $\operatorname{In} 2$. The result of combining in Out is also a date and time.
The following example is for when In1 is D\#1970-1-7 and In2 is TOD\#23:59:59.999999999.
LD ST

abc:=CONCAT_DATE_TOD(D\#1970-1-7,
TOD\#23:59:59.999999999);

Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Precautions for Correct Use

An error occurs in the following case. ENO will be FALSE, and Out will not change.

- The results of combining exceeds the valid range of Out (e.g., the value of In1 is D\#2554-7-21 and the value of $\operatorname{In} 2$ is larger than TOD\#23:34:33.709551615).

## DT＿TO＿TOD

The DT＿TO＿TOD instruction extracts the time of day from a date and time．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DT＿TO＿TOD | Extract Time of Day from Date and Time | FUN |  | Out：＝DT＿TO＿TOD（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Date and <br> time | Input | Date and time | Depends on data type． | Year，month， <br> day，hour， <br> minutes，sec－ <br> onds | DT\＃1970－ <br> $1-1-0: 0: 0$ |

| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The SetTime instruction sets the system time to date and time In．
The following programming example is for when In is DT\＃1970－1－7：23：59：59．999999999．

LD

ST

SetTime（DT\＃1970－1－7－23：59：59．999999999）；

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Additional Information

The following methods can also be used to set the system time.

- Sysmac Studio
- NTP function

## Precautions for Correct Use

- For In, specify the time for the set time zone (do not specify Greenwich mean time (GMT)).
- You cannot set a time in In that is lower than 1970-1-1-0:0:0.000000000 GMT.
- A time lag will occur when updating the internal time. If the time is read immediately after executing this instruction, the old time may be read.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of $I n$ is outside of the valid range.
- The value of $I n$ is below 1970-1-1-0:0:0.000000000 GMT.

## GetTime

The GetTime instruction reads the current time．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GetTime | Get Time of Day | FUN | （＠）GetTime  <br> EN ENO <br>   | Out：＝GetTime（）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Out | Current <br> time | Output | Current time | Depends on data type． | Year，month， <br> day，hour， <br> minutes，sec－ <br> onds | --- |

|  |  |  | it s | ngs |  |  |  |  |  |  |  |  |  |  |  |  | $\begin{aligned} & \text { nes } \\ & \text { s, ar } \end{aligned}$ | $\begin{aligned} & \text { dur } \\ & \text { d te) } \end{aligned}$ | tion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 罟 | $\begin{aligned} & \text { 四 } \\ & \text { 푸 } \end{aligned}$ | $\sum$ O O | O O D | 「 O O | $\underset{\underset{1}{\varrho}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | 들 | $\frac{C}{\sum_{1}^{C}}$ | ${\underset{-1}{\infty}}_{\infty}^{\infty}$ | $\underset{-1}{ }$ | ${\underset{Z}{Z}}_{\square}^{\square}$ | $\sum_{-1}^{5}$ | m m 2 | $\begin{aligned} & \text { ro } \\ & \text { m } \\ & \stackrel{1}{2} \end{aligned}$ | － | 号 | － | 먹 |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |

## Function

The GetTime instruction reads the current time．The current time of day is the time for the set time zone （not Greenwich mean time（GMT））．
The following figure shows a programming example．The current time is assigned to variable abc．

LD
$+\mathrm{EN}_{\mathrm{EN}}^{\text {GetTime }} \mathrm{ENO}-\mathrm{abc}$
abc：＝GetTime（）；

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Additional Information

- Use the DtToSec instruction (page 2-574) to convert the current time of day to the system time of day (number of seconds from 00:00:00 on January 1,1970).
- Use the DtToDateStruct instruction (page 2-597) to convert the current time of day to a date (year, month, day, minutes, and seconds).
- Use the GetDayOfWeek instruction (page 2-593) to read the day of the week.

## DtToSec

The DtToSec instruction converts a date and time to the number of seconds from 00:00:00 on January 1, 1970.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DtToSec | Convert Date and Time to Seconds | FUN |  | Out:=DtToSec(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Date and <br> time | Input | Date and time | Depends on data type. | Year, month, <br> day, hour, <br> minutes, sec- <br> onds | DT\#197 <br> $0-1-1-$ <br> $0: 0: 0$ |
| Out | Seconds | Output | Number of seconds from <br> 00:00:00 on January 1, 1970 | 0 to 18446744073 | Seconds | --- |

|  |  |  | Bit | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \mathrm{a} \end{aligned}$ | $\begin{aligned} & \text { dur } \\ & \text { d te) } \end{aligned}$ | tion |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O <br> O | $\begin{aligned} & \text { ロ } \\ & \text { In } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | 0 0 0 0 0 | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & 0 \\ & 0 \end{aligned}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\substack{C}}{\subseteq}$ | $\frac{0_{i}^{c}}{z_{1}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | ${\underset{Z}{2}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\sum_{-1}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \Gamma \\ & \pi \\ & \pi \\ & \hline \end{aligned}$ | $\frac{\text { 근 }}{\overline{1}}$ | 号 | 움 | 먹 | $\xrightarrow{\text { n }}$ |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |

## Function

The DtToSec instruction converts the date and time in In to the number of seconds from 00:00:00 on January 1, 1970. The converted value is in seconds. The value is truncated below the seconds.
The following example is for when In is DT\#1970-1-2-0:0:0.999999999.

LD

|  | In |
| :---: | :---: |
|  | DT\#1970-1-2-0:0:0.999999999 |
| - | DT\#1970-1-1-0:0:0.000000000 |
|  |  |
|  |  |
|  |  |

|  | In |
| :---: | :--- |
|  | DT\#1970-1-2-0:0:0.999999999 |
| - | DT\#1970-1-1-0:0:0.000000000 |
|  |  |
|  |  |
|  |  |
|  |  |

ST
abc:=DtToSec(DT\#1970-1-2-0:0:0.999999999);

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Additional Information

Use the SecToDt instruction (page 2-578) to convert the number of seconds from 00:00:00 on January 1,1970 to a date and time.

## DateToSec

The DateToSec instruction converts a date to the number of seconds from 00:00:00 on January 1, 1970.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DateToSec | Convert Date to Seconds | FUN |  | Out:=DateToSec(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Date | Input | Date | Depends on data type. | Year, month, <br> day | DT\#197 <br> $0-1-1$ |
| Out | Seconds | Output | Number of seconds from <br> $00: 00: 00$ on January 1, 1970 | 0 to 18446659200 | Seconds | --- |

## Function

The DateToSec instruction converts 00:00:00 on date In to the number of seconds from 00:00:00 on January 1, 1970. The converted value is in seconds.
The following example is for when In is D\#1970-1-2.

## Additional Information

Use the SecToDate instruction (page 2-580) to convert the number of seconds from 00:00:00 on January 1,1970 to a date.

## TodToSec

The TodToSec instruction converts a time of day to the number of seconds from 00：00：00．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TodToSec | Convert Time of Day to Seconds | FUN |  | Out：＝TodToSec（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :---: | :--- | :--- | :--- | :--- | :--- |
| In | Time of day | Input | Time of day | Depends on data type． | Hour，min－ <br> utes，seconds | TOD\＃0：0 <br> $: 0$ |
| Out | Seconds | Output | Number of seconds from <br> 00：00：00 | 0 to 86399 | Seconds | --- |

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |

| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |

## Function

The TodToSec instruction converts the time of day in In to the number of seconds from 00：00：00．The converted value is in seconds．The value is truncated below the seconds．
The following example is for when In is TOD\＃12：0：0．999999999．

LD

## Additional Information

Use the SecToTod instruction（page 2－582）to convert the number of seconds from 00：00：00 on January 1,1970 to a time of day．

ST
abc：＝TodToSec（TOD\＃12：0：0．999999999）；

## SecToDt

The SecToDt instruction converts the number of seconds from 00:00:00 on January 1, 1970 to a date and time.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SecToDt | Convert Seconds to Date and Time | FUN |  | Out:=SecToDt(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Seconds | Input | Number of seconds from <br> 00:00:00 on January 1, 1970 | 0 to 18446744073 | Seconds | 0 |
| Out | Date and <br> time | Output | Date and time | Depends on data type. | Year, month, <br> day, hour, <br> minutes, sec- <br> onds | --- |

| In |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |

## Function

The SecToDt instruction converts the number of seconds from 00:00:00 on January 1, 1970 in In to a date and time.
The following example is for when In is LINT\#86400.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Additional Information

Use the DtToSec instruction (page 2-574) to convert the current time of day to the number of seconds from 00:00:00 on January 1,1970.

## Precautions for Correct Use

An error occurs in the following case. ENO will be FALSE, and Out will not change.

- The value of $I n$ is outside of the valid range.

## SecToDate

The SecToDate instruction converts the number of seconds from 00：00：00 to a date．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SecToDate | Convert Seconds to Date | FUN |  | Out：＝SecToDate（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Seconds | Input | Number of seconds from <br> $00: 00: 00$ | 0 to 18446744073 | Seconds | 0 |
| Out | Date | Output | Date | Depends on data type． | Year，month， <br> day | --- |

|  |  |  | it s | ings |  |  |  |  |  |  |  |  |  |  |  |  | mes | $\begin{aligned} & \text { dure } \\ & \text { d tex } \end{aligned}$ | $\begin{aligned} & \text { tion } \\ & \text { str } \end{aligned}$ |  |

| In |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |

## Function

The SecToDate instruction converts the number of seconds from 00：00：00 in In to a date．The value is truncated below date．

The following example is for when In is LINT\＃86400．

## Additional Information

Use the DateToSec instruction（page 2－576）to convert a date to the number of seconds from 00：00：00 on January 1，1970．

## Precautions for Correct Use

An error occurs in the following case. ENO will be FALSE, and Out will not change.

- The value of $I n$ is outside of the valid range.

## SecToTod

The SecToTod instruction converts the number of seconds from 00：00：00 to a time of day．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SecToTod | Convert Seconds to Time of Day | FUN |  | Out：＝SecToTod（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Seconds | Input | Number of seconds from <br> $00: 00: 00$ | Depends on data type． | Seconds | 0 |
| Out | Time of day | Output | Time of day | Depends on data type． | Hour，min－ <br> utes，seconds | --- |

＊Negative numbers are excluded．

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 睘 | $\begin{aligned} & \text { ロ } \\ & \text { 군 } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ |  | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { N } \end{aligned}$ | $\frac{C}{\sum_{1}^{C}}$ | $\underset{\vdots}{\subseteq}$ | $\frac{\text { 들 }}{3}$ | $\frac{\mathrm{C}}{\sum_{1}}$ | $\underset{-1}{\infty}$ | $\sum_{1}$ | $\underset{\sim}{\text { 은 }}$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \mathbb{D} \\ & \text { 苋 } \end{aligned}$ | $\begin{aligned} & \text { 「D } \\ & \text { 塄 } \end{aligned}$ | $\stackrel{-1}{3}$ | $\begin{aligned} & \text { 另 } \\ & \text { m } \end{aligned}$ | - | 먹 | 足 |
| In |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |
| Out |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |  |

## Function

The SecToTod instruction converts the number of seconds from 00：00：00 in In to a time of day．If the value of $I n$ is 24 hours or longer，$I n$ is divided by 24 and the remainder is converted to the time of day． The following example is for when In is LINT\＃86410．

LD

ST
abc：＝SecToTod（LINT\＃86410）；
$\begin{array}{ll} \\ \text { In } \\ \text { TOD\＃00：00：00 } & \text { Remainder of division by } 24 \\ & \text { Out＝abc } \text { TOD\＃0：0：10．000000000 } \\ \end{array}$

## Additional Information

Use the TodToSec instruction（page 2－577）to convert a time of day to the number of seconds from 00：00：00 on January 1，1970．

## TimeToNanoSec

The TimeToNanoSec instruction converts a time to nanoseconds．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :--- | :--- | :---: | :---: |
| TimeToNanoSec | Convert Time to <br> Nanoseconds | FUN | （＠）TimeToNanoSec <br> EN <br> ENO <br> In | Out：＝TimeToNanoSec（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Time | Input | Time | Depends on data type． | ns | T\＃0s |
| Out | Nanosec－ <br> onds | Output | Nanoseconds | $*$ | ns | --- |

## Function

The TimeToNanoSec instruction converts the time in In to nanoseconds．
The following example is for when In is T\＃1d1h1m1．999999999s．

LD

Nanoseconds
In T\＃1d1h1m1．999999999s $\longrightarrow$ Out＝abc LINT\＃90061000000000 ns

## Additional Information

Use the NanoSecToTime instruction（page 2－585）to convert nanoseconds to a time．

## TimeToSec

The TimeToSec instruction converts a time to seconds.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :--- | :--- |
| TimeToSec | Convert Time to <br> Seconds | FUN | (@)TimeToSec <br> EN <br> ENO | Out:=TimeToSec(In); |

## Function

The TimeToSec instruction converts the time in In to seconds. The value is truncated below the seconds.
The following example is for when In is T\#1d1h1m1.999999999s.

LD

In T\#1d1h1m1.999999999s $\xrightarrow{\text { Seconds }}$ Out=abc LINT\#90061s

## Additional Information

Use the SecToTime instruction (page 2-586) to convert seconds to a time.

## Precautions for Correct Use

In is in nanoseconds. Out is in seconds.

## NanoSecToTime

The NanoSecToTime instruction converts nanoseconds to a time．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| NanoSecToTime | Convert Nanosec－ onds to Time | FUN |  | Out：＝NanoSecToTime（In）； |

## Variables

## Function

The SecToTime instruction converts the number of seconds in In to a time． The following example is for when $\ln$ is LINT\＃90061．

LD
（

In LINT\＃90061 $\mathrm{s} \xrightarrow{\text { Time }}$ Out＝abc $\xrightarrow{\text { T\＃1d1h1m1s }}$

## Additional Information

Use the TimeToSec instruction（page 2－584）to convert a time to seconds．

## Precautions for Correct Use

- In is in seconds. Out is in nanoseconds.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The value of $I n$ is outside of the valid range.

## ChkLeapYear

The ChkLeapYear instruction is used to check for a leap year.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ChkLeapYear | Check for Leap Year | FUN |  | Out:=ChkLeapYear(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Year | Input | Year | 1970 to 2554 | Year | 1970 |
| Out | Result | Output | TRUE: Leap year <br> FALSE: Not leap year | Depends on data type. | --- | -- |

## Function

The ChkLeapYear instruction is used to check to see if year In is a leap year. If it is a leap year, the value of result Out is TRUE. If it is not a leap year, Out is FALSE.
The following example is for when In is UINT\#2012.

## Precautions for Correct Use

If the value of In exceeds the valid range, an error will not occur and the value of Out will be an illegal value.

## GetDaysOfMonth

The GetDaysOfMonth instruction gets the number of days in the specified month．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GetDaysOfMonth | Get Days in Month | FUN |  | Out：＝GetDaysOfMonth（Year， Month）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Year | Year | Input | Year | 1970 to 2554 | Year | 1970 |
|  | Month |  | Month | 1 |  |  |
| Out | Month |  | Output | Days | 28 to 31 | Days |

|  | 0） $\frac{0}{0}$ $\stackrel{0}{3}$ |  | Bit s | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { mes } \\ & \mathrm{s}, \mathrm{a} \end{aligned}$ | dur | tions |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 罟 } \\ & \text { ( } \end{aligned}$ | $\begin{aligned} & \text { 四 } \\ & \text { n } \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \text { O } \\ & \text { O } \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{i}^{\Gamma} \\ & \text { N } \end{aligned}$ | $\underset{\underset{Z}{6}}{\substack{C}}$ | $\underset{\underset{1}{C}}{\substack{C}}$ | $\frac{\text { 들 }}{}$ | $\underset{\underset{1}{\mathrm{C}}}{\stackrel{C}{2}}$ | $\sum_{-1}^{\infty}$ | $\bar{Z}_{1}$ | $\underset{\text { 은 }}{ }$ | $\sum_{-1}^{5}$ | $\begin{aligned} & \text { I } \\ & \text { m } \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \underset{\sim}{\pi} \\ & \underset{\sim}{2} \end{aligned}$ | $\frac{-1}{\overline{3}}$ | 号 | －1 | 먹 | 号 |
| Year |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Month |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The GetDaysOfMonth instruction gets the number of days in month Month of year Year．
The following example is for when Year is UINT\＃2012 and Month is USINT\＃2．

## Precautions for Correct Use

－If the value of Year exceeds the valid range，an error will not occur and the value of Out will be an ille－ gal value．
－An error occurs in the following case．ENO will be FALSE，and Out will not change．
－The value of Month is outside of the valid range．

## Sample Programming

This sample gets the number of days in the current month.
LD

| Internal <br> Variables | Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- | :---: |
|  | abc | sDT | (Year: $=0$, Month $:=0$, Day $:=0$, Hour: $=0$, Min $:=0$, Sec $:=0$, NSec: $:=0)$ | Date and time |

| Out | Month | Output | Month | 1 to 12 | Month | --- |

## Function

The DaysToMonth instruction calculates the month based on the number of days in Days from January 1 in year Year.
The following example is for when Year is UINT\#2012 and Days is UINT\#32.

## Precautions for Correct Use

- If the value of Year exceeds the valid range, an error will not occur and the value of Out will be an illegal value.
- An error occurs in the following case. ENO will be FALSE, and Out will not change.
- The value of Days is outside of the valid range.

## GetDayOfWeek

The GetDayOfWeek instruction gets the day of the week for the specified year，month，and day of month．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GetDayOfWeek | Get Day of Week | FUN |  | Out：＝GetDayOfWeek（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Year， <br> month，day | Input | Year，month，day | Depends on data type． | Year，month， <br> day | ＊ |
| Out | Day of the <br> week | Output | Day of the week | ＿MON，＿TUE，＿WED， <br> THU，＿FRI，＿SAT， <br> $-S U N$ | Day of the <br> week | －－－ |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

|  |  | Bit strings |  |  |  | Integers |  |  |  |  |  |  |  |  |  | Times，durations， dates，and text strings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ¢0 | $\begin{aligned} & \text { ロ } \\ & \underset{\sim}{n} \end{aligned}$ | $\begin{aligned} & \sum \\ & 0 \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{0} \\ & \text { O} \\ & \text { D } \end{aligned}$ | $\begin{aligned} & \sum_{0}^{\Gamma} \\ & \text { D } \end{aligned}$ | $\underset{\underset{Z}{C}}{\substack{C}}$ | $\underset{\underset{-1}{C}}{\substack{C}}$ | $\frac{\text { C }}{\sum_{1}^{\prime}}$ | $\frac{\underset{i}{c}}{\underset{1}{c}}$ | ${\underset{Z}{1}}_{\infty}^{\infty}$ | $\bar{Z}_{1}$ | ${\underset{N}{2}}_{0}$ | $\sum_{\underset{1}{ }}^{\Gamma}$ | $\begin{aligned} & \text { D } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { 「 } \\ & \text { m } \\ & \stackrel{\pi}{8} \end{aligned}$ | $\begin{aligned} & \text { 글 } \\ & \end{aligned}$ | $\begin{aligned} & \text { 另 } \\ & \text { m } \end{aligned}$ | 응 | 먹 | 号 |
| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  | OK |  |
| Out | Refer to Function for the enumerators for the enumerated type＿eDAYOFWEEK． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The GetDayOfWeek instruction gets the day of the week for the year，month，and day of month speci－ fied in In．
The data type of Out is enumerated type＿eDAYOFWEEK．The meanings of the enumerators are as fol－ lows：

| Enumerator | Meaning |
| :--- | :--- |
| ＿MON | Monday |
| ＿TUE | Tuesday |
| ＿WED | Wednesday |
| ＿THU | Thursday |
| ＿FRI | Friday |
| ＿SAT | Saturday |
| ＿SUN | Sunday |

The following example is for when $I n$ is $D \# 2011-1-1$.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## GetWeekOfYear

The GetWeekOfYear instruction gets the week number for the specified year，month，and day of month．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GetWeekOfYear | Get Week Number | FUN | $(@)$ GetWeekOfYear <br> EN <br> $-\ln$  | Out：＝GetWeekOfYear（In）； |

## Variables

| Name | Meaning | I／O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Year， <br> month，day | Input | Year，month，day | Depends on data type． | Year，month， <br> day | ＊ |
| Out | Week | Output | Week number | 1 to 54 | Week | --- |

＊If you omit the input parameter，the default value is not applied．A building error will occur．

The GetWeekOfYear instruction gets the week number for the year，month，and day of month specified in In．Weeks are counted from Monday to Sunday．The count is incremented when changing from Sun－ day to Monday．
January 1 is always in week 1 ．For example，if January 1 is a Thursday，January 1 to January 4 （Sun－ day）is week 1 and January 5 （Monday）to January 11 （Sunday）is week 2.
The following example is for when $I n$ is D\＃2011－2－1．

|  | 00 <br> 0 <br> $\frac{0}{0}$ <br> $\stackrel{0}{3}$ |  | s | ings |  |  |  |  | Inte |  |  |  |  |  |  |  | $\begin{aligned} & \text { imes, } \\ & \text { es, an } \end{aligned}$ | $\mathrm{du}$ | $\begin{aligned} & \text { Itions } \\ & \text { t strit } \end{aligned}$ |  |

| In |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | OK |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| DateStruct | Refer to Function for details on the structure＿sDT． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The DtToDateStruct instruction converts the date and time in In to the year，month，day，hour，minutes， seconds，and nanoseconds．The data in the broken down date and time in Out is the structure＿sDT． The meanings of the members are as follows：

| Name | Meaning | Content | Data type | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Out | Date and time | Date and time as a year， <br> month，day，hour，minutes， <br> seconds，and nanoseconds | sDT | --- | --- | --- |
| Year | Year | Year | UINT | 1970 to 2554 | Year |  |
| Month | Month | Month | USINT | 1 to 12 | Month |  |
| Day | Day | Day | USINT | 1 to 31 | Day |  |
| Hour | Hour | Hour | USINT | 0 to 23 | Hour |  |
| Min | Minutes | Minutes | USINT | 0 to 59 | Minutes |  |
| Sec | Seconds | Seconds | USINT | 0 to 59 | Seconds |  |
| Nsec | Nanoseconds | Nanoseconds | ULINT | 0 to 999999999 | Nanoseconds |  |

The following example is for when In is DT\#1970-1-2-12:34:56.999999999.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January $1,1970$. |

## Additional Information

- Use the DateStructToDt instruction (page 2-599) to join a year, month, day, hour, minutes, seconds, and nanoseconds into a date and time.
- The following example shows how to find the current time of day.

## Precautions for Correct Use

Return value Out is not used when the instruction is used in ST.

## DateStructToDt

The DateStructToDt instruction joins a year, month, day, hour, minutes, seconds, and nanoseconds into a date and time.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| DateStructToDt | Join Time | FUN |  | Out:=DateStructToDt(In); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| In | Date and <br> time | Input | Date and time as a year, <br> month, day, hour, minutes, <br> seconds, and nanoseconds | --- | --- | --- |
| Out | Date and <br> time | Output | Date and time | Depends on data type. | Year, month, <br> day, hour, <br> minutes, sec- <br> onds | --- |

## Function

The DateStructToDt instruction joins the year, month, day, hour, minutes, seconds, and nanoseconds in In into a date and time. The data type of $I n$ is structure _sDT. The meanings of the members are as follows:

| Name | Meaning | Content | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | Date and time | Date and time as a year, month, day, hour, minutes, seconds, and nanoseconds | _sDT | --- | --- | -- |
| Year | Year | Year | UINT | 1970 to 2554 | Year | 1970 |
| Month | Month | Month | USINT | 1 to 12 | Month | 1 |
| Day | Day | Day | USINT | 1 to 31 | Day |  |
| Hour | Hour | Hour | USINT | 0 to 23 | Hour | 0 |
| Min | Minutes | Minutes | USINT | 0 to 59 | Minutes |  |
| Sec | Seconds | Seconds | USINT | 0 to 59 | Seconds |  |
| Nsec | Nanoseconds | Nanoseconds | ULINT | 0 to 999999999 | Nanoseconds |  |

The following example is for the following values for the members of In: Year is UINT\#1970, Month is USINT\#1, Day is USINT\#2, Hour is USINT\#12, Min is USINT\#34, Sec is USINT\#56, and Nsec is ULINT\#999999999.

Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CurrentTime | System Time of Day | DT | The time of day from the system clock. The num- <br> ber of seconds from 00:00:00 on January 1,1970. |

## Additional Information

Use the DtToDateStruct instruction (page 2-597) to break down a date and time into a year, month, day, hour, minutes, seconds, and nanoseconds.

## Precautions for Correct Use

An error occurs in the following cases. ENO will be FALSE, and Out will not change.

- The value of a member of $I n$ is outside of the valid range.
- The processing result exceeds the valid range of Out.

## System Control Instructions

| Instruction | Name | Page |
| :--- | :--- | :---: |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { © } \\ & \text { O } \end{aligned}$ | $\begin{aligned} & \text { ロ } \\ & \underset{\sim}{m} \end{aligned}$ | $\sum$ O D | 0 0 0 0 0 | $\Gamma$ 0 0 0 0 | $\underset{-1}{\stackrel{C}{2}}$ | $\underset{\underset{-1}{C}}{\substack{C}}$ | $\frac{C}{0_{i}^{\prime}}$ | $\frac{\mathrm{C}}{\underset{1}{\mathrm{C}}}$ | $\sum_{-1}^{\infty}$ | $\bar{z}_{1}$ | ${\underset{N}{1}}_{0}$ | $\bar{z}_{-1}$ | $\begin{aligned} & \text { ग } \\ & \stackrel{\pi}{\mathbb{2}} \end{aligned}$ | $\begin{aligned} & \text { r } \\ & \text { m } \\ & \stackrel{\pi}{2} \end{aligned}$ | $\stackrel{-1}{\overline{1}}$ | 号 | 금 | 머 | 号 |
| TraceNo |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Point |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The TraceSamp instruction performs sampling for a data trace．The sampling settings are specified from the Sysmac Studio．The present values for all variables that are set to be sampled are read and stored with trace number TraceNo and sampling point number Point in trace memory．This instruction is executed only during execution of data tracing and only when the sampling timing is set to sampling instructions from the Sysmac Studio．
The following figure shows a programming example．Trace number 1 and sampling point number 2 are attached，and the present values of all variables to be sampled are stored in trace memory．

LD

ST

TraceSamp（USINT\＃1，USINT\＃2）；

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _PLC_TraceSta[0..3] | Trace Information | $*$ | Trace information <br> Refer to the NJ-series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |

* _sTRACE_STA[]

## Additional Information

- Refer to the NJ-series CPU Unit Software User's Manual (Cat. No. W501) for details on data tracing.
- Tracing is used to sample the values of specified variables under specified conditions. The conditions are specified from the Sysmac Studio.
- This instruction can be located in more than one place in the user program. Programming can be written to sample according to specific conditions.
- Point can be suitably set so that you can see which sampled values on the Trace Window in the Sysmac Studio were returned by which TraceSamp instruction. Point will default to 0 if it is omitted.

## Precautions for Correct Use

- Return value Out is not used when the instruction is used in ST.
- In the following cases, nothing is done and the instruction ends normally.
- Data tracing is stopped.
- The sampling timing is not set to sampling instructions in the trace settings.
- The value of TraceNo is not the trace number set from the Sysmac Studio.

## Sample Programming

Here, sampling is performed at the end of each process A to $D$. The values of the variables are stored at each point.

LD

Process D

ST

## Process A

TraceSamp(USINT\#O, USINT\#11);
Process B
TraceSamp(USINT\#1, USINT\#12);
Process C
TraceSamp(USINT\#2, USINT\#13);
Process D
TraceSamp(USINT\#3, USINT\#14);

## TraceTrig

The TraceTrig instruction generates a trigger for data tracing.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| TraceTrig | Data Trace Trigger | FUN | (@) TraceTrig <br> EN <br> ITaceNo <br> TNO- Out | TraceTrig(TraceNo); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| TraceNo | Trace num- <br> ber | Input | Trace number | 0 to 3 | --- | 0 |
| Out | Return <br> value | Output | Always TRUE | TRUE only | --- | --- |

## Function

The TraceTrig instruction generates a trigger for data tracing. It does not matter whether the trigger conditions that were set from the Sysmac Studio have been met. Sampling starts if data tracing is in progress for trace number TraceNo when the instruction is executed.
The following figure shows a programming example. Here, a data trace trigger is generated for trace number 1.

LD

ST

TraceTrig(USINT\#1);

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _PLC_TraceSta[0..3] | Trace Information | * | Trace information <br> Refer to the NJ-series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |

* _sTRACE_STA[]

## Additional Information

- Refer to the NJ-series CPU Unit Software User's Manual (Cat. No. W501) for details on data tracing.
- This instruction can be located in more than one place in the user program. Programming can be written to generate a trigger according to specific conditions.
- Programming can be written to generate triggers in ways that are not possible for normal trigger conditions settings, such as programming to generate a trigger based on a comparison of two variables.

## Precautions for Correct Use

- Return value Out is not used when the instruction is used in ST.
- In the following cases, nothing is done and the instruction ends normally.
- Data tracing is stopped.
- The trigger condition has already been met.
- The value of TraceNo is not the trace number set from the Sysmac Studio.
- A continuous trace is specified as the trace type for the trace number that is specified with TraceNo.

## Sample Programming

Here, a data trace trigger is generated to store the values of variables when the current speed exceeds the maximum speed. The TraceTrig instruction is executed when the value of Current_speed exceeds the value of Max_speed.
LD

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| Current speed | INT | 0 | Current speed |
| Max_speed | INT | 20 | Maximum speed |

ST

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| Current_speed | INT | 0 | Current speed |
| Max_speed | INT | 20 | Maximum speed |

[^12]
## GetTraceStatus

The GetTraceStatus instruction reads the execution status of a data trace．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GetTraceStatus | Read Data Trace Status | FUN |  | GetTraceStatus（TraceNo， IsStart，IsComplete， <br> ParamErr，IsTrigger）； |

Variables

| IsComplete | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ParamErr | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| IsTrigger | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The GetTraceStatus instruction reads the execution status of the data trace that is specified with trace number TraceNo. The status that is read is output to execution flag IsStart, completed flag IsComplete, parameter error flag ParamErr, and trigger flag IsTrigger.
The value of ParamErr changes to TRUE when one of the following errors is found in the trace settings.

- A variable that is specified in the trigger or sampling settings does not exist.
- Sampling is set to be performed on a specified task period, but the specified task does not exist.

The following figure shows a programming example. The GetTraceStatus instruction reads the execution status of the data trace with trace number 1.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _PLC_TraceSta[0..3] | Trace Information | * | Contains trace Information. <br> Refer to the NJ-series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |

* _sTRACE_STA[]

## Additional Information

Refer to the NJ-series CPU Unit Software User's Manual (Cat. No. W501) for details on data tracing.

## Precautions for Correct Use

- Return value Out is not used when the instruction is used in ST.
- This instruction reads the contents of the _PLC_TraceSta[] system-defined variable. You cannot access this variable directly. Always use this instruction to read the contents of the variable.
- If TraceNo is not in the valid range, the values of IsStart, IsComplete, ParamErr, and IsTrigger are FALSE.

## Sample Programming

In this sample, the GetTraceStatus instruction reads the execution status of the data trace with trace number 3. If the data trace is in progress, the TraceTrig instruction is executed to trigger data tracing.
LD

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :---: |
| StaFlag | BOOL | False | Trace execution status |
| A | BOOL | False |  |
| B | BOOL | False |  |

ST

| Variable | Data type | Initial value | Comment |
| :--- | :--- | :--- | :--- |
| StaFlag | BOOL | False | Trace execution status |
| A | BOOL | False |  |
| B | BOOL | False |  |

GetTraceStatus(TraceNo:=USINT\#3, IsStart=>StaFlag);
IF ( (StaFlag=TRUE) AND (A=TRUE) AND (B=TRUE) ) THEN TraceTrig(TraceNo:=USINT\#3);
END_IF;

## SetAlarm

The SetAlarm instruction creates a user-defined error.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SetAlarm | Create Userdefined Error | FUN |  | SetAlarm(Code, Info1, Info2); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Code | Event code | Input | Event code of user-defined error to generate | 1 to 40000 | --- | 1 |
| Info1 | Attached information 1 |  | Values recorded in event log when the user-defined error is generated | Depends on data type. |  |  |
| Info2 | Attached information 2 |  |  |  |  | * |
| Out | Return value | Output | Always TRUE | TRUE only | --- | --- |

* If you omit the input parameter, the default value is not applied. A building error will occur.

## Function

The SetAlarm instruction generates the user-defined error that corresponds to event code Code. Event codes are defined in the event setting table on the Sysmac Studio. The time of occurrence, event name, event group, event code Code, event level, additional information Info1, additional information Info2, and detailed information are stored in the user event log area that corresponds to the level of the event code. The value for the time of occurrence is automatically obtained. The event name, event group, and detailed information that are set from the Sysmac Studio are recorded. The event level that corresponds to the event code is recorded. The event levels are given below. The smaller the event code is, the higher the event level is.

| Event code | Classification: User fault level |
| :--- | :--- |
| 1 to 5000 | 1 |
| 5001 to 10000 | 2 |
| 10001 to 15000 | 3 |
| 15001 to 20000 | 4 |
| 20001 to 25000 | 5 |
| 25001 to 30000 | 6 |
| 30001 to 35000 | 7 |
| 35001 to 40000 | 8 |

The following figure shows a programming example. A user-defined error with event code 101 is generated. The values of variables $a b c$ and def are stored as attached information.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _AlarmFlag | Error Status of User- <br> defined Errors | WORD | These flags indicate when user-defined errors are <br> detected. |
|  |  | Bit 0 to bit 7 indicate the status of user-defined <br> error levels 1 to 8. <br> Refer to the NJ-series CPU Unit Software User's <br> Manual (Cat. No. W501) for details. |  |

## Additional Information

You can specify either global variables or local variables for Info1 and Info2.

## Precautions for Correct Use

- Up to 32 user-defined errors can be generated in each of the eight event levels (for up to 256 userdefined errors total).
- If a user-defined error for the same event code already exists, the new error is not recorded in the event log.
- Always use variables for the input parameters that pass Info1 and Info2. If you use a constant, a building error will occur.
- An error does not occur even if the value of Code is not set as a event code on the Sysmac Studio. If the event code is not registered, the event group and detailed information are not recorded in the user-defined event log. The value of Code is recorded for the event name.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE.
- The value of Code is outside of the valid range.
- An attempt was made to generate more than the maximum number of user-defined errors.

## Sample Programming

In this sample, the value of variable $A$ changes between TRUE and FALSE every five seconds. The value of $A$ is monitored. If it does not change for more than five seconds, a user-defined error with event code 102 is generated. UINT\#123 and UINT\#456 are given as the attached information.

When variable F changes to TRUE, the user-defined error is cleared.

## Function

The ResetAlarm instruction resets the user－defined error specified by event code Code．An event is then recorded in the user－defined event log to show that a specific user－defined error was reset．The event code for this event is 65533 and the level is user information．
If the value of Code is 0 ，all current user－defined errors are reset．An event is then recorded in the user－ defined event log to show that all user－defined errors were reset．The event code for this event is 65534 and the level is user information．
The following figure shows a programming example．A user－defined error for event code 101 is reset．

LD
（ $\left.\right|_{\text {UINT\＃101 }} ^{\substack{\text { ResetAlarm } \\ \text { Code }}}$
ST
ResetAlarm（UINT\＃101）；

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _AlarmFlag | Error Status of User- <br> defined Errors | WORD | These flags indicate when user-defined errors <br> are detected. |
|  |  |  | Bit 0 to bit 7 indicate the status of user-defined <br> error levels 1 to 8. |
|  |  |  | Refer to the NJ -series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |

## Precautions for Correct Use

- An error does not occur if the user-defined error specified by Code has not occurred.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE.
- The value of Code is outside of the valid range.

## Sample Programming

Refer to the sample programming that is provided for the SetAlarm instruction (page 2-610).

## GetAlarm

The GetAlarm instruction gets the highest event level（of user－defined error levels 1 to 8 ）and the high－ est level event code of the current user－defined errors．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GetAlarm | Get User－defined Error Status | FUN |  | Out：＝GetAlarm（Level， Code）； |

## Variables

| Code |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The GetAlarm instruction gets the highest event level and the highest level event code of the current user－defined errors and outputs them to Level and Code．If there are currently no user－defined errors， the value of error flag Out is FALSE．If there is more than one use－defined error at the highest event level，the value of Code is the event code for the user－defined error that occurred first．

The following figure shows a programming example.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _AlarmFlag | Error Status of User- <br> defined Errors | WORD | These flags indicate when user-defined errors <br> are detected. |
|  |  |  | Bit 0 to bit 7 indicate the status of user-defined <br> error levels 1 to 8. |
|  |  |  | Refer to the NJ -series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |

## Precautions for Correct Use

If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.

## ResetPLCError

The ResetPLCError instruction resets errors in the PLC Function Module.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ResetPLCError | Reset PLC Controller Error | FB | ResetPLCError_instance | ResetPLCError(Execute, Done, Busy, Error, ErrorID); |

## Variables

Only common variables are used.

## Function

The ResetPLCError instruction resets errors in the PLC Function Module.
The following figure shows a programming example.
LD

Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _PLC_ErrSta | Error Status of PLC | WORD | Contains the error status of the PLC Func- <br> tion Module, <br> Refer to the NJ-series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |
|  | Function Module |  |  |
|  |  |  |  |

## Precautions for Correct Use

The error may not be reset immediately after you execute this instruction. Use the GetPLCError instruction to confirm that the errors were reset.

## Sample Programming

The ResetPLCError instruction is executed when the value of Trigger changes to TRUE. Normal end processing is performed if execution of the ResetPLCError instruction ends normally (i.e., if the value of Done is TRUE). Error end processing is performed if execution ends in an error (i.e., if the value of Error is TRUE).

LD

| UnitNo |  |  |  |  | $r$ to | Functis | ¢ | the | num | rato | of | en | ， | d | e | Unit |  |  |  |  |

## Function

The ResetCJBError instruction resets a Controller error in the I／O bus．If the Unit specified by unit num－ ber UnitNo is a CJ－series Special Unit，the Unit is restarted．
The data type of UnitNo is enumerated type＿eUnitNo．The meanings of the enumerators are as fol－ lows：

| Enumerators | Meaning |
| :--- | :--- |
| ＿CBU＿No00 to＿CBU＿No15 | Unit number of CPU Bus Unit，00 to 15 |
| ＿SIO＿No00 to＿SIO＿No95 | Unit number of Special I／O Unit，00 to 95 |
| ＿UNIT＿ALL | All Units |

The following example is for when UnitNo is _CBU_No00. The Controller error on the I/O bus is reset and the CPU Bus Unit with unit number 0 is restarted.

ST

ResetCJBError_instance(A, _CBU_NoOO,
abc, def, ghi, jkl);

Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _CJB_ErrSta | I/O Bus Error Status | WORD | Contains the error status of the I/O bus. <br> Refer to the $N J$-series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |

## Precautions for Correct Use

- The error may not be reset immediately after you execute this instruction. Use the GetCJBError instruction to confirm that the errors were reset.
- An error occurs in the following cases. ENO will be FALSE.
- The value of UnitNo is outside of the valid range.
- The Unit specified by UnitNo does not exist.

## GetCJBError

The GetCJBError instruction gets the highest level status（partial fault or minor fault）and highest level event code of the current Controller errors in the I／O bus．

| Instruction | Name | FB／FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| GetCJBError | Get I／O Bus Error Status | FUN | -（＠）GetCJBError  <br> EN Level <br> Code  －Out | Out：＝GetCJBError（Level， Code）； |

## ResetMCError

The ResetMCError instruction resets Controller errors in the Motion Control Function Module.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ResetMCError | Reset Motion Control Error | FB |  | ResetMCError_instance( <br> Execute, Done, Busy, <br> Failure Error, ErrorID); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Failure | Failure end | Output | TRUE: The errors were not <br> reset. <br> FALSE:The errors were <br> reset normally. | Depends on data type. | --- | --- |

## Function

The ResetMCError instruction resets a Controller error in the Motion Control Function Module. If the errors are not reset, the value of Failure changes to TRUE.
The following figure shows a programming example.

LD

ST

ResetMCError_instance(A, abc, def, ghi, jkl, mno);

Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _MC_ErrSta | Motion Control Error <br> Status | WORD | Contains the error status of the Motion Con- <br> trol Function Module. <br> Refer to the NJ-series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |

## Precautions for Correct Use

- The error may not be reset immediately after you execute this instruction. Use the GetMCError instruction to confirm that the errors were reset.
- If you attempt to execute this instruction during an MC Test Run, the value of BUSY remains TRUE and the instruction is not executed.

## Sample Programming

This sample detects Controller errors in the EtherCAT Master Function Module and Motion Control Function Module. If errors are detected, they are reset. The processing procedure is as follows:

1 The GetECError instruction is executed to detect any Controller errors in the EtherCAT Master Function Module.

2 If errors are detected, they are reset with the ResetECError instruction.
3 The GetMCError instruction is executed to detect any Controller errors in the Motion Control Function Module.

4
If errors are detected, they are reset with the ResetMCError instruction.

LD

| Variable | Data type | Initial <br> value | Comment |
| :--- | :--- | :--- | :--- |
| Request | BOOL | False | Error detection reset request |
| EC_Operating | BOOL | False | Resetting error in EtherCAT Master Function Module |
| MC_Operating | BOOL | False | Resetting error in Motion Control Function Module |
| Normal_End | BOOL | False | Normal end |
| ResetECError_instance | ResetECError |  |  |
| ResetMCError_instance | ResetMCError |  |  |

Execute GetECError instruction.
Request
EN $\begin{aligned} \text { GetECError } \\ \text { Level } \\ \text { Code_- }\end{aligned}$
Execute ResetECError instruction if error occurs in EtherCAT Master Function Module.

Execute GetMCError instruction after resetting error in EtherCAT Master Function Module or if there is no error.

Execute ResetMCError instruction if error occurs in Motion Control Function Module.

Processing after normal end

ST

| Out | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The SetInfo instruction generates the user-defined information specified by event code Code. The time of occurrence, event code Code, event level, attached information Info1, and attached information Info2 are stored in the user event log area that corresponds to the level of the event code.
The following figure shows a programming example. User-defined information for event code 40001 is generated. The values of variables $a b c$ and def are stored as attached information.
LD
ST
SetInfo(UINT\#40001, abc, def);

## Precautions for Correct Use

- Always use variables for the input parameters that are passed to Info1 and Info2. If the attached information is not used, specify a dummy variable.
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following case. ENO will be FALSE.
- The value of Code is outside of the valid range.

## ResetUnit

The ResetUnit instruction restarts a CPU Bus Unit or Special I/O Unit.

| Instruction | Name | FB/FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| ResetUnit | Restart Unit | FB |  | ResetUnit_instance(Execute, UnitNo, Done, Busy, Error, ErrorID); |

Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| UnitNo | Unit num- <br> ber | Input | Unit number of Unit to <br> restart | _CBU_No00 to <br> _CBU_No15, <br> _SIO_No00 to <br> _SIO_No95 | --- | -CBU <br> -No00 |

## Function

The ResetUnit instruction restarts the CPU Bus Unit or Special I/O Unit with unit number UnitNo.
The data type of UnitNo is enumerated type _eUnitNo. The meanings of the enumerators are as follows:

| Enumerators | Meaning |
| :--- | :--- |
| _CBU_No00 to _CBU_No15 | Unit number of CPU Bus Unit, 00 to 15 |
| _SIO_No00 to _SIO_No95 | Unit number of Special I/O Unit, 00 to 95 |

The following example is for when UnitNo is _CBU_No00. CPU Bus Unit with unit number 0 is restarted.

## Precautions for Correct Use

- This instruction will not end in an error even if restart processing is in progress for the Unit specified by UnitNo. The value of Busy remains at TRUE and the value of Done changes to TRUE when restart processing is finished. Restart requests are not queued.
- The Unit is restarted if the value of Execute is TRUE when operation starts.
- An error occurs in the following cases. Error will change to TRUE.
- The value of UnitNo is outside of the valid range.
- The Unit specified with UnitNo does not exist.
- Restart processing failed.

## Sample Programming

When the value of Trigger changes to TRUE, the baud rate of serial port 1 on the Serial Communications Unit with a unit number of 0 is set to 38,400 bps and the Unit is restarted.

| Exec Normal | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The GetNTPStatus instruction reads the NTP status．The following information is read：NTP last normal operation time ExecTime and normal end flag ExecNormal．
The following figure shows a programming example．

LD

ST

GetNTPStatus（abc，def）；

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _EIP_NTPResult | NTP Status | $*$ | Contains the NTP status. <br> Refer to the NJ-series CPU Unit Software <br> User's Manual (Cat. No. W501) for details. |

* _sNTP_RESULT

## Precautions for Correct Use

- Return value Out is not used when the instruction is used in ST.
- This instruction reads the contents of the _EIP_NTPResult system-defined variable. You cannot access this variable directly. Always use this instruction to read the contents of the variable.

## Communications Instructions

## Function

The ExecPMCR instruction requests execution of the sequence that is specified with communications sequence number SeqNo from the specified destination port Port.
If data is sent, it is sent from the second element (SrcDat[1]) of send data array SrcDat[]. The number of array elements to send is specified in SrcDat[0].
If data is received successfully, the receive data is stored from the second element (DstDat[1]) of receive data array DstDat[]. The number of receive data elements is stored in DstDat[0].
If data is not received successfully, the contents of DstDat[] from before instruction execution is retained for the number of elements specified in DstDat[0].

The data type of destination port Port is the structure _sPORT. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Port | Destination port | Destination port | _sPORT | --- | --- | --- |
| UnitNo | Unit number | Unit number of Serial Communications Unit | _eUnitNo | $\begin{aligned} & \text { _CBU_NoOO to } \\ & \text { _CBU_No15 } \end{aligned}$ |  | $\begin{aligned} & \text { CBU_ } \\ & \text { NoOO } \end{aligned}$ |
| PhysicPortNo | Serial port number | Serial port number on Serial Communications Unit | USINT | 1 or 2 | --- | 1 |

The following figure shows a timing chart. Communications is performed to the end after the value of Done changes to TRUE.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _Port_numUsingPort | Number of Used Ports | USINT | This is the number of ports that are currently used. |
| _Port_isAvailable | Network Communica- <br> tions Instruction <br> Enabled Flag | BOOL | TRUE: A port is available. <br> FALSE: A port is not available. |
| _CJB_SCU\#\#P1ChgSta, <br> _CJB_SCU\#\#P2ChgSta* | Serial Communica- <br> tions Unit \#\# Port 1/2 <br> Settings Changing Flag | BOOL | TRUE: The serial port settings are currently being <br> changed. |
| FALSE: The serial port settings are currently not <br> being changed. |  |  |  |

* "\#\#" denotes the unit number on the Serial Communications Unit.

## Related Semi-user-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| P\#_PmrExecSta* | Protocol Macro Execu- <br> tion Flag | BOOL | TRUE: Protocol macro execution is in progress. <br> FALSE: Protocol macro execution is not in progress <br> or failed. |
| P\#_PmrSeqEndSta* | Sequence End Com- <br> pletion Flag | BOOL | TRUE: The sequence was completed with an End. <br> FALSE: The sequence was not completed with an <br> End. |
| P\#_PmrSeqAbtSta* | Sequence Abort Com- <br> pletion Flag | BOOL | TRUE: The sequence was completed with an Abort. <br> FALSE: The sequence was not completed with an <br> Abort. |

* "\#" denotes the port number on the Serial Communications Unit.

## Additional Information

Refer to the SYSMAC CX-Protocol Operation Manual (Cat. No. W344) for details on protocol macros.

## Precautions for Correct Use

- The ExecPMCR instruction starts execution of a protocol macro. Use the P\#PmrExecSta (Protocol Macro Execution Flag) system-defined variable to check the status of protocol macro execution.
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- An address in memory for CJ-series Units must be specified in the AT Specification attribute of DstDat[].
- Set the value of SrcDat[0] and DstDat[0] to 0 to use a direct specification and link word specification. An error occurs if you set any other constant or variable, and the instruction is not executed.
- If the value of $\operatorname{DstDat[O]}$ is 0 or 1 and reception fails, all elements in DstDat[] change to 0 .
- The instruction is executed only when there is an available port. Therefore, use the system-defined variable _Port_isAvailable (Network Communications Instruction Enabled Flag) in an N.O. execution condition for the instruction.
- The instruction is not executed while Busy is TRUE. Therefore, use Busy in an N.C. execution condition for the instruction.
- The Protocol Macro Execution Flag (semi-user-defined variable P\#_PmrExecSta) changes to TRUE when instruction execution is started. It changes to FALSE after the communications sequence is completed and the receive data is stored in DstDat [] . You cannot execute this instruction for the same serial port while P\#_PmrExecSta is TRUE. Therefore, use P\#_PmrExecSta in an N.C. execution condition for the instruction.
- If the instruction is used in ST, make sure that the instruction is processed each task period as long as instruction execution continues. Otherwise, normal processing is sometimes not possible.
- An error occurs in the following cases. Error will change to TRUE.
- The serial communications mode is not set to Protocol Macro Mode when the instruction is executed.
- The value of _Port_isAvailable is FALSE.
- The value of SeqNo is outside of the valid range.
- The value of SeqNo is not registered to a Serial Communications Unit.
- The value of Port.UnitNo or Port.PhysicPortNo is outside of the valid range.
- There is no CJ-series Serial Communications Unit with the specified unit number.
- The value of SrcDat[0] exceeds the size of SrcDat[].
- The value of DstDat[0] exceeds the size of DstDat[].
- The value of SrcDat[0] or DstDat[0] exceeds 250 words.
- Communications fail.
- An address in memory for CJ-series Units is not specified in the AT Specification attribute of DstDat[].
- For this instruction, expansion error code ErrorIDEx gives the communications response code. The values and meanings are listed in the following table. An expansion error code is output to ErrorIDEx when the value of error code ErrorID is WORD\#16\#0800.

| Value | Error | Correction |
| :---: | :--- | :--- |
| $16 \# 00001106$ | The value of SeqNo is not a regis- <br> tered communications sequence <br> number. | • Correct the value of SeqNo. <br> - Add the sequence with the CX-Protocol. |
| $16 \# 00002201$ | Instruction execution is already in <br> progress. The values of Busy and <br> P\#_PmrExecSta are TRUE. | Use P\#_PmrExecSta in an N.C. input as the execution <br> condition for the instruction. |
| $16 \# 00002202$ | The protocol is being switched, so <br> execution is not possible. | Use_CJB_SCU\#\#P1ChgSta or <br> CJB_SCU\#\#P2ChgSta Serial Communications Unit, <br> Port 1/2 Settings Changing Flag in an N.C. input as the <br> execution condition for the instruction. |
| $16 \# 00002401$ | A checksum error occurred in the <br> protocol macro data or the data <br> transfer is not yet completed. | Transfer the protocol macro data from the CX-Protocol. |

## Sample Programming

In this sample, a CJ-series Serial Communications Unit is used for data communications with an OMRON Temperature Controller. The present value of the Temperature Controller is read with a protocol macro. CompoWay/F master sequence 610 (Read Variable Area) is used. The contents of send data array SendData[] is sent from the Controller. The data received from the Temperature Controller is stored in receive data array RecvData[].
The following communications specifications are used.

| Item | Description |
| :--- | :--- |
| Unit used | Serial Communications Unit |
| Unit number | 2 |
| Port number | 1 (RS-422/485) |
| Communications <br> sequence number | 610 (Read Variable Area) |
| Remote node number | 3 |
| Data to read | Present value |

The communications data for sequence 610 (Read Variable Area) is allocated as shown below.

| Send Data: WORD Array |  |  |
| :---: | :---: | :---: |
| SendData[0] | Nu | data words |
| SendData[1] | Not used. | Node No. |
| SendData[2] | Variable type |  |
| SendData[3] | Read start address |  |
| SendData[4] | Number of elements |  |

| Receive Data: WORD Array |  |
| :--- | :---: |
| RecvData[0] | Number of receive data words |
| RecvData[1] | Response code |
| RecvData[2] | Receive data |
| RecvData[3] |  |

The contents of send data SendData[] and receive data RecvData[] are as follows:
Send Data: WORD Array

| Variable | Item | Contents | Value |
| :--- | :--- | :--- | :--- |
| SendData[0] | Number of send data <br> words | Five words from Send- <br> Data[0] to SendData[4] <br> are sent. | WORD\#16\#0005 |
| SendData[1] | Node number | Node 3 is used. | WORD\#16\#0003 |
| SendData[2] | Variable type + Upper byte <br> of read start address | To read the present value, <br> the variable type is <br> BYTE\#16\#C0 and the | WORD\#16\#C000 |
| Sead start address is <br> WORD\#16\#00. | WORD\#16\#0000 |  |  |
| SendData[3] | Lower byte of read start <br> address + BYTE\#16\#00 <br> (fixed value) | Number of elements | One element is read. |

Receive Data: WORD Array

| Variable | Item | Contents | Value |
| :--- | :--- | :--- | :---: |
| RecvData[0] | Number of receive data <br> words | Four words from Recv- <br> Data[0] to RecvData[3] <br> are received. | WORD\#16\#0004 |
| RecvData[1] | Response code | WORD\#16\#0000 is <br> returned for a normal end. |  |
| RecvData[2] | The lower two bytes of the <br> present value of the Tem- <br> perature Controller are <br> returned. |  |  |
| RecvData[3] | The upper two bytes of the <br> present value of the Tem- <br> perature Controller are <br> returned. |  |  |

If the data is received successfully, the lower two bytes (RecvData[2]) and the upper two bytes (RecvData[3]) of the present value of the Temperature Controller are assigned to TmpData.

## SerialSend

The SerialSend instruction sends data in No-protocol Mode from a serial port on a Serial Communications Unit.

| Instruction | Name | $\begin{aligned} & \hline \text { FB/ } \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| SerialSend | SCU Send Serial | FB |  | SerialSend_instance(Execute, Port, SrcDat, SendSize, Done, Busy, Error, ErrorID, ErrorIDEx); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Port | Destination port | Input | Destination port | --- | --- | --- |
| SrcDat[] (array) | Send data array |  | Send data array | Depends on data type. |  | * |
| SendSize | Number of send data elements |  | Number of elements to send from SrcDat[] | 0 to 256 | Bytes | 1 |

* If you omit an input parameter, the default value is not applied. A building error will occur.

## Function

The SerialSend instruction sends data in No-protocol Mode from the port and the Serial Communications Unit specified with Port. The data that is sent is contained in send data array SrcDat[]. The number of array elements to send is specified in number of send data elements SendSize.
To attach start and end codes to the send data, set them in the DM Area words that are assigned to the Special Unit.
If you add start and end codes, the maximum number of bytes to send is 259 (1-byte start code, 2-byte end code (for CR+LF specification), and 256 bytes of send data).
The data type of destination port Port is the structure _sPORT. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Port | Destination port | Destination port | _sPORT | --- | --- | --- |
| UnitNo | Unit number | Unit number of Serial Communications Unit | _eUnitNo | _CBU_NoOO to _CBU_No15 |  | $\begin{aligned} & \hline \text { CBU_ } \\ & \text { NoOO } \end{aligned}$ |
| PhysicPortNo | Serial port number | Serial port number on Serial Communications Unit | USINT | 1 or 2 | --- | 1 |

The following figure shows a timing chart. Communications is performed to the end after the value of Done changes to TRUE.

Data transmission started.
SerialSend Instruction Execution Flag changes to TRUE.

* "\#" denotes the port number on the Serial Communications Unit.

## Additional Information

Refer to the following manual for details on no-protocol communications.

- CJ-series Serial Communications Units Operation Manual for NJ-series CPU Unit (Cat. No. W494)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- You can use this instruction only for a Serial Communications Unit's serial port that is set to No-protocol Mode.
- Nothing is sent if the value of SendSize is 0 . When the instruction is executed, the value of Done changes to TRUE.
- Even when attaching a start or end code, do not include it in the value of SendSize.
- The instruction is executed only when there is an available port. Therefore, use the system-defined variable _Port_isAvailable (Network Communications Instruction Enabled Flag) in an N.O. execution condition for the instruction.
- The instruction is not executed while Busy is TRUE. Therefore, use Busy in an N.C. execution condition for the instruction.
- You cannot execute this instruction while the SerialSend Instruction Executing Flag (semi-userdefined variable P\#NopSerialSendExecSta) is TRUE. Use P\#NopSerialSendExecSta in an N.C. execution condition for the instruction.
- If the instruction is used in ST, make sure that the instruction is processed each task period as long as instruction execution continues. Otherwise, normal processing is sometimes not possible.
- You cannot use this instruction in the primary periodic task.
- An error occurs in the following cases. Error will change to TRUE.
- The serial communications mode is not set to No-protocol Mode when the instruction is executed.
- The value of _Port_isAvailable is FALSE.
- The value of Port.UnitNo or Port.PhysicPortNo is outside of the valid range.
- There is no CJ-series Serial Communications Unit with the specified unit number.
- The value of SendSize is outside of the valid range.
- The value of SendSize exceeds the size of SrcDat[].
- Communications fail.
- The instruction is executed during a Unit restart.
- For this instruction, expansion error code ErrorIDEx gives the communications response code. The values and meanings are listed in the following table. An expansion error code is output to ErrorIDEx when the value of error code ErrorID is WORD\#16\#0800.

| Value | Meaning |
| :--- | :--- |
| $16 \# 00000401$ | The serial communications mode is set to Protocol Macro, NT Link, Echoback Test, or <br> Serial Gateway Mode. |
| $16 \# 00000205$ | The serial communications mode is set to Host Link Mode. |
| $16 \# 00001001$ | The command is too long. |
| $16 \# 00001002$ | The command is too short. |
| $16 \# 00001003$ | The value of SendSize does not match the number of send bytes. |
| $16 \# 00001004$ | The command format is incorrect. |
| $16 \# 0000110 \mathrm{C}$ | This is another parameter error. |
| $16 \# 00002201$ | The SerialSend or SerialRcv instruction is already in execution. |
| $16 \# 00002202$ | The protocol is being switched, so execution is not possible. |

## Sample Programming

In this sample, a no-protocol command is sent to the barcode reader that is connected to serial port 2 of a CJ-series Serial Communications Unit (unit number 0, device name 'Barcode'). The Read Scene Number command (@READ) is sent. The send data is the contents of the array variable SendDat[]. There is no start code and the end code is 16\#OD (CR).

The settings of Serial Communications Unit are given in the following table.

| Item | Set value |
| :--- | :--- |
| Port 2: User-specified Setting Inclusion | User settings |
| Port 2: Serial Communications Mode | No-protocol |
| Port 2: Data Length | 8 bits |
| Port 2: Stop Bits | 1 bit |
| Port 2: Parity | No |
| Port 2: Baud Rate | $38,400 \mathrm{bps}$ |

| Item | Set value |
| :--- | :--- |
| Port 2: No-Protocol End Code | D |
| Port 2: No-Protocol Start Code Inclusion Setting | No |
| Port 2: No-Protocol End Code Inclusion Setting | Yes (Specify a desired end code.) |

The text string '@READ' is separated into individual characters and the character codes are stored in the array elements of SendDat[]. Therefore, BYTE\#16\#40 (@) is stored in SendDat[0], BYTE\#16\#52(R) is stored in SendData[1], etc. The StringToAry instruction is used to store the character codes.

| STRING data | StringToAry | BYTE array |  |
| :---: | :---: | :---: | :---: |
|  |  | SendDat[0] | BYTE\#16\#40 |
|  |  | SendDat[1] | BYTE\#16\#52 |
| '@READ' |  | SendDat[2] | BYTE\#16\#45 |
|  |  | SendDat[3] | BYTE\#16\#41 |
|  |  | SendDat[4] | BYTE\#16\#44 |

## Function

First, data is received in No-protocol Mode from the serial port specified with Port and stored in the receive buffer in the Serial Communications Unit. This instruction transfers the number of bytes specified with receive data size Size from the receive buffer to receive data array DstDat[].
After the data is transferred, the number of array elements that was actually stored in DstDat [] is assigned to the number of receive data array elements RcvSize. If the amount of data in the receive buffer is smaller than Size, all of the data in the receive buffer is transferred to DstDat[]. The number of array elements that was actually stored in DstDat[] is assigned to RcvSize. The receive buffer is cleared after the data is transferred.
Device variables are used in the user program to recognize the start code and end code in the receive data. The start and end codes are deleted from the receive data before it is stored in DstDat[].

| Code to attach | Device variable for port 1 | Value |
| :--- | :--- | :--- |
| Specified start code | P1_NopStartCodeYNCfg | TRUE |
|  | P1_NopStartCodeCfg | Start code (16\#00 to <br> 16\#FF) |
|  | P1_NopEndCodeYNCfg | TRUE |
|  | P1_NopCRLFCfg | FALSE |
|  | P1_NopEndCodeCfg | End code (16\#00 to <br> 16\#FF) |
| CR+LF as end code | P1_NopEndCodeYNCfg | TRUE |
|  | P1_NopCRLFCfg | TRUE |

If you add start and end codes, the maximum number of bytes to receive is 259 (1-byte start code, 2byte end code (for CR+LF specification), and 256 bytes of send data).

The data type of destination port Port is the structure _sPORT. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Port | Destination port | Destination port | _sPORT | --- | --- | --- |

* "\#" denotes the port number on the Serial Communications Unit.

## Additional Information

- The Reception Completed Flag (P\#_NopRcvCompleteSta) changes to TRUE at the following times.
- The amount of data set in Number of No-protocol Receive Data Bytes (P\#_NopRcvDatSzCfg) is received.
- The specified end code is received.
- A total of 256 bytes of data is received.
- The Reception Overflow Flag (P\#_NopRcvOvfSta) changes to TRUE at the following times.
- Data is received when this instruction is not executed and the Reception Completed Flag ( $P \#$ _NopRcvCompleteSta) is TRUE.
- More than the amount of data set in Number of No-protocol Receive Data Bytes ( $P \#$ _NopRcvDatSzCfg) is received.
- Refer to the following manual for details on no-protocol communications.
- CJ-series Serial Communications Units Operation Manual for NJ-series CPU Unit (Cat. No. W494)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- Execute the instruction only when the Reception Completed Flag (P\#_NopRcvCompleteSta) is TRUE.
- When data is received, always execute this instruction to transfer the data in the receive buffer to DstDat[]. No more data is received until the previous data is transferred.
- The receive buffer in the Serial Communications Unit is cleared when this instruction is executed. Therefore, you cannot separate the data in the receive buffer to transfer it to DstDat[].
- Reception stops automatically after 259 bytes of data is received. If this instruction is not executed after that and more data is received, Overrun Error (P\#_OverRunErr) changes to TRUE.
- Any receive data that exceeds the size specified with Size is discarded the next time the instruction is executed.
- Even when a start or end code is attached, do not include it in the value of Size.
- You can use this instruction only for a Serial Communications Unit's serial port that is set to No-protocol Mode.
- If the value of Size is 0 , the data in the receive buffer is not transferred to DstDat[]. If that occurs, the Reception Completed Flag (P\#_NopRcvCompleteSta) and Reception Overflow Flag ( $P \#$ _NopRcvOvfSta) will change to FALSE. Also, the Reception Counter (P\#_NopRcvCntSta) will be 0.
- The instruction is executed only when there is an available port. Therefore, use the system-defined variable _Port_isAvailable (Network Communications Instruction Enabled Flag) in an N.O. execution condition for the instruction.
- Execute the instruction only when the Reception Completed Flag (P\#_NopRcvCompleteSta) is TRUE.
- The instruction is not executed while Busy is TRUE. Therefore, use Busy in an N.C. execution condition for the instruction.
- If the instruction is used in ST, make sure that the instruction is processed each task period as long as instruction execution continues. Otherwise, normal processing is sometimes not possible.
- An error occurs in the following cases. Error will change to TRUE.
- The serial communications mode is not set to No-protocol Mode when the instruction is executed.
- The value of _Port_isAvailable is FALSE.
- The value of Port.UnitNo or Port.PhysicPortNo is outside of the valid range.
- There is no CJ-series Serial Communications Unit with the specified unit number.
- The value of Size is outside of the valid range.
- The value of Size exceeds the size of DstDat[].
- Communications fail.
- The instruction is executed during a Unit restart.
- For this instruction, expansion error code ErrorIDEx gives the communications response code. The values and meanings are listed in the following table. An expansion error code is output to ErrorIDEx when the value of error code ErrorID is WORD\#16\#0800.

| Value | Meaning |
| :--- | :--- |
| $16 \# 00000401$ | The serial communications mode is set to Protocol Macro, NT Link, Echoback Test, or <br> Serial Gateway Mode. |
| $16 \# 00000205$ | The serial communications mode is set to Host Link Mode. |
| $16 \# 00001001$ | The command is too long. |
| $16 \# 00001002$ | The command is too short. |
| $16 \# 00001004$ | The command format is incorrect. |
| $16 \# 0000110 C$ | This is another parameter error. |
| $16 \# 00002201$ | The SerialSend or SerialRcv instruction is already in execution. |
| $16 \# 00002202$ | The protocol is being switched, so execution is not possible. |

## Sample Programming

In this sample, data that was read by the barcode reader that is connected to serial port 2 of a CJ-series Serial Communications Unit (unit number 0, device name 'Barcode') is received. The receive data is stored in array variable RecvDat[]. There is no start code and the end code is 16\#OD (CR).

The settings of Serial Communications Unit are given in the following table.

| Item | Set value |
| :--- | :--- |
| Port 2: User-specified Setting Inclusion | User settings |
| Port 2: Serial Communications Mode | No-protocol |
| Port 2: Data Length | 8 bits |
| Port 2: Stop Bits | 1 bit |
| Port 2: Parity | No |
| Port 2: Baud Rate | 38,400 bps |
| Port 2: No-Protocol End Code | D |
| Port 2: No-Protocol Start Code Inclusion Setting | No |
| Port 2: No-Protocol End Code Inclusion Setting | Yes (Specify a desired end code.) |

The number from the barcode reader is separated into individual characters and bit strings for the character codes are stored in RecvDat[]. One element of the RecvDat[] array corresponds to one character from the barcode. First, the AryToString instruction is used to convert the data to a text string (RecvStringDat). Then, the STRING_TO_ULINT instruction is used to convert the data to an ULINT integer (Code).

## Function

The SendCmd instruction sends the contents of command array CmdDat[] to the destination specified with destination network address DstNetAdr and destination serial port CommPort. The command data size CmdSize specifies how many elements of CmdDat[] contain the command. The response that is returned is stored in response storage array RespDat $[$.
The data type of DstNetAdr is structure _sDNET_ADR. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| DstNetAdr | Destination <br> network <br> address | Destination network <br> address | _sDNET_ADR | --- |  |  |
| NetNo | Network <br> address | Network address | USINT | 0 |  | 0 |
| NodeNo | Node address | Node address | USINT |  | --- | 0 |
| UnitNo | Unit address | Unit address | BYTE | Depends on <br> data type. |  | $16 \# 00$ |

The destination node is found with routing tables. If the value of DstNetAdr.NetNo is 0 , the data is routed through the built-in EtherNet/IP port. If the value of DstNetAdr.NodeNo is 255 , the data is broadcast to all nodes with the specified network address.

The data type of CommPort is enumerated type _ePORT. The meanings of the enumerators of enumerated type _ePORT are as follows:

| Enumerators | Meaning |
| :--- | :--- |
| _NONE | The destination is not a serial port in Host Link Mode. |

The data type of Option is structure _sRESPONSE. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Option | Response | Response monitoring and retry specifications | _sRESPONSE | --- | --- | --- |
| isNonResp | No response | TRUE:Response is not required. <br> FALSE:Response is required. | BOOL | Depends on data type. | --- | FALSE |
| TimeOut | Timeout time | Timeout time $0: 2.0 \mathrm{~s}$ | UINT |  | 0.1 s | $\begin{array}{\|l\|} \hline 20 \\ (2.0 \mathrm{~s}) \\ \hline \end{array}$ |
| Retry | Retry count | Retry count | USINT | 0 to 15 | Times | 0 |

If the value of the Response Not Necessary Flag (Option.isNonResp) is FALSE and the response does not return within the value set for the Timeout Time (Option.TimeOut), the command is resent until there is a response. Option.Retry specifies the number of retries. The timeout time is Option.TimeOut multiplied by 0.1 s . However, if the value of Option.TimeOut is 0 , the timeout time is 2.0 s . The default value of Option.TimeOut is 2.0 s . No responses are received for broadcast data. Also, the command is not resent.

## Related System-defined Variables

| Name | Meaning | Description |
| :--- | :--- | :--- |
| _Port_numUsingPort | Number of Used Ports | This is the number of ports that are currently used. |
| _Port_isAvailable | Network Communica- <br> tions Instruction <br> Enabled Flag | TRUE: A port is available. <br> FALSE: A port is not available. |

## Additional Information

- The command or response is sometimes lost during communications due to noise or other factors. You can increase reliability by setting Option.Retry to a value higher than 0 to perform retry processing when a response is not returned.
- To specify a serial port with the serial gateway function, specify the unit address of the serial port for DstNetAdr.NetNo. The unit addresses of the ports on Serial Communications Units are as follows:
- Port 1

Unit address $=$ BYTE\#16\#80 + BYTE\#16\#04 $\times$ unit number (hex)
Example for Unit Number 1
BYTE\#16\#80+BYTE\#16\#04 $\times 1=$ BYTE\#16\#84

- Port 2

Unit address $=$ BYTE\#16\#81 + BYTE\#16\#04 $\times$ unit number (hex)
Example for Unit Number 2
BYTE\#16\#81+BYTE\#16\#04 $\times 2=$ BYTE\#16\#89

## Precautions for Correct Use

- The instruction is executed only when there is an available port. Therefore, use the system-defined variable _Port_isAvailable (Network Communications Instruction Enabled Flag) in an N.O. execution condition for the instruction.
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- If the instruction is used in ST, make sure that the instruction is processed each task period as long as instruction execution continues. Otherwise, normal processing is sometimes not possible.
- The command is not sent if the value of CmdSize is 0 . When the instruction is executed, the value of Done changes to TRUE.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- An error occurs in the following cases. Error will change to TRUE.
- The value of CommPort is outside of the valid range.
- The value of a member of DstNetAdr is outside of the valid range.
- The value of CmdSize is outside of the valid range.
- The value of a member of Option is outside of the valid range.
- The value of CmdSize exceeds the size of CmdDat[].
- The response size exceeds the size of RespDat[].
- The value of _Port_isAvailable is FALSE.
- Communications fail.
- For this instruction, expansion error code ErrorIDEx gives the communications response code. The values and meanings are listed in the following table. An expansion error code is output to ErrorIDEx when the value of error code ErrorID is WORD\#16\#0800.

| Value | Error | Correction |
| :---: | :---: | :---: |
| 16\#00000101 | The local node is not part of the network. | Make the local node part of the network. |
| 16\#00000105 | The IP address of the local node is out of range. | Set the rotary switches on the Serial Communications Unit correctly. |
| 16\#00000106 | The IP address of the local node is also used by another node in the network. | Change one of the node addresses that are duplicated. |
| 16\#00000202 | A Unit with the specified unit address does not exist at the destination. | Correctly set the unit address for the destination network address. |
| 16\#00000301 | A Communications Controller Error occurred. | Refer to the operation manual for the relevant Unit and make suitable corrections. |
| 16\#00000304 | The unit number setting is not correct. | Set the rotary switches on the Serial Communications Unit correctly. |
| 16\#00000401 | The command that was sent is not supported. | Set the command string correctly. |
| 16\#00000402 | The Unit model or version is not supported. | Check the Unit model and version. |
| 16\#00001001 | The command is too long. | Set the command string correctly. |
| 16\#00001002 | The command is too short. | Set the command string correctly. |
| 16\#00001003 | The number of write elements that is specified in the command does not agree with the number of write data. | Specify the same number of write elements and write data. |
| 16\#00001004 | The command format is incorrect. | Set the command string correctly. |
| 16\#0000110B | The response is too long. | Set the number of elements in the command string correctly. |
| 16\#0000110C | This is another parameter error. | Set the command string correctly. |
| 16\#00002202 | The operating mode is wrong. | Check the operating mode. |
| 16\#00002502 | There is an error in the part of memory for processing. | Transfer the correct data to memory. |
| 16\#00002503 | The registered I/O Unit configuration does not agree with the physical Unit configuration. | Check the I/O Unit configuration. |
| 16\#00002504 | There are too many local or remote I/O points. | Set the number of local and remote I/O points correctly. |
| 16\#00002505 | An error occurred in a data transmission between the CPU Unit and a CPU Bus Unit. | Check the Unit and the Connecting Cable. After removing the error, execute a command to reset the error. |
| 16\#00002506 | The same rack number, unit number, or I/O address is set more than once. | Correct the settings so that each number is unique. |
| 16\#00002507 | An error occurred in a data transmission between the CPU Unit and an I/O Unit. | Check the Unit and the Connecting Cable. After removing the error, execute a command to reset the error. |
| 16\#00002509 | There is an error in SYSMAC BUS/2 data transmission. | Check the Unit and the Connecting Cable. After removing the error, execute a command to reset the error. |
| 16\#0000250A | An error occurred in a CPU Bus Unit data transmission. | Check the Unit and the Connecting Cable. After removing the error, execute a command to reset the error. |
| 16\#0000250D | The same word setting is used more than once. | Set the I/O words correctly. |
| 16\#00002510 | The end station setting is wrong. | Set the end station correctly. |

## Sample Programming

In this sample, the SendCmd instruction sends an explicit message via a DeviceNet Unit. This sample reads the vendor ID from the slave with node address 16\#0B through the DeviceNet Unit with unit address 16\#10.
The following communications specifications are used.

| Item | Description |
| :--- | :--- |
| Unit address of DeviceNet Unit | $16 \# 10$ |
| Slave node address | $16 \# 0 \mathrm{~B}$ |
| Service code | $16 \# 0 \mathrm{E}$ |
| Class ID | 1 |
| Instance ID | 1 |
| Attribute ID | 1 |
| Timeout time | 2.0 s |
| Retry count | 2 |

Slave with node address 16\#0B
The contents of command array SendDat[] and response storage array RecvDat[] are as follows:
Command Array: BYTE array

| Array element | Item | Content | Value |
| :--- | :--- | :--- | :--- |
| SendDat[0] | Command code | The command code to send an <br> explicit message is 16\#2801. | BYTE\#16\#28 |
| SendDat[1] |  | The node address is 16\#0B. | BYTE\#16\#0B |
| SendDat[2] | Service code | The service code to read the value of <br> a specified attribute (Get Attribute <br> Single) is 16\#0E. | BYTE\#16\#0E |
| SendDat[3] | Class ID | The class ID of the Identity object is <br> $16 \# 0001$. | BYTE\#16\#00 |
|  |  | --- | BYTE\#16\#01 |
| SendDat[4] | Instance ID | The attribute ID of the vendor ID <br> (Vendor ID) is 16\#01. | BYTE\#16\#01 |
| SendDat[5] | Attribute ID |  |  |
| SendDat[6] |  |  |  |

Response Storage Array: BYTE Array

| Array element | Item | Content |
| :--- | :--- | :--- |
| RecvDat[0] | Command code | The command code to send an explicit message is <br> 16\#2801. |
| RecvDat[1] | Completion code | The completion code is 16\#0000 for a normal end. |
| RecvDat[2] | Number of bytes received after | 4 bytes |
| RecvDat[3] | the slave node address |  |$\quad$| RecvDat[4] | Slave node address | The node address is 16\#0B for a normal end. |
| :--- | :--- | :--- |
| RecvDat[5] | Service code | Slave vendor ID. |
| RecvDat[6] | Vendor ID |  |
| RecvDat[7] $[8]$ | RecvDat[9] |  |

| Handle | Refer to Function for details on the structure＿sCIP＿HANDLE． |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The CIPOpen instruction opens a CIP class 3 connection with another Controller on a CIP network．The other Controller is specified with route path RoutePath．The handle Handle is output when the connec－ tion is open．
TimeOut specifies the timeout time．If a response does not return within the timeout time，it is assumed that communications failed．The timeout time is reset when the CIPRead，CIPWrite，or CIPSend instruction is executed．

The data type of Handle is structure＿sCIP＿HANDLE．The specifications are as follows：

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Handle | Handle | Handle | ＿sCIP＿ <br> HANDLE | --- | --- | --- |
| Handle | Handle | Handle | UDINT | Depends on <br> data type． | --- | --- |

The following figure shows a programming example.

Related System-defined Variables

| Name | Meaning | Data <br> type | Description |
| :--- | :--- | :--- | :--- |
| _EIP_EtnOnlineSta | Online | BOOL | Status of built-in EtherNet/IP port communications <br> TRUE: Can be used. <br> FALSE: Cannot be used. |

## Additional Information

Refer to the following manuals for details on CIP communications.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CJ-series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- You must execute this instruction before you execute CIPRead, CIPWrite, or CIPSend.
- For this instruction, the first timeout time after a connection is established is 10 s even if the value of TimeOut is set to less than 100 (10 s).
- Use the CIPClose instruction to close connections that were opened with the CIPOpen instruction.
- Even if the connection times out, the handle created by this instruction will remain. Always use the CIPClose instruction to close the connection.
- Handles that are created with this instruction are disabled when you change to PROGRAM mode.
- You can create a maximum of 32 handles at the same time.
- You can use this instruction only through a built-in EtherNet/IP port on an NJ-series CPU Unit or a port on an EtherNet/IP Unit connected to an NJ-series CPU Unit.
- This instruction does not use ErrorIDEx.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The text string in RoutePath does not end in a NULL character.
- The value of TimeOut is outside of the valid range.

## Sample Programming

This sample uses CIP class 3 messages to write a variable, read a variable, and send a message. The Controllers are connected to an EtherNet/IP network. The IP address of the remote node is 192.168.250.2.

The following procedure is used.
1 The CIPOpen instruction is used to open a class 3 connection. The timeout time is 2 s .
2 The CIPWrite instruction is used to write the value of a variable at a remote node. The variable name at the remote node is WritingDat and the contents of the WriteDat is written to it. WritingDat must be defined as a global variable at the remote node and the Network Publish attribute must be set.

3 The CIPRead instruction is used to read the value of a variable at a remote node. The value of the variable OriginalDat at the other node is read and the read value is stored in the ReadDat variable. OriginalDat must be defined as a global variable at the remote node and the Network Publish attribute must be set.
4 The CIPSend instruction is used to send an explicit message to a remote node. The contents of the message is to read identity information (product name). The class ID, instance ID, attribute ID, and service code are as follows: The response data is stored in the ResDat variable.

| Item | Value |
| :--- | :--- |
| Class ID | 1 |
| Instance ID | 1 |
| Attribute ID | 7 |
| Service code | $16 \# 0 \mathrm{E}$ |

5
The CIPClose instruction is used to close the class 3 connection.

Message sent to read identity information (product name).

## CIPRead

The CIPRead instruction uses a class 3 explicit message to read the value of a variable in another Controller on a CIP network.

| Instruction | Name | $\begin{aligned} & \hline \text { FB/ } \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CIPRead | Read Variable Class 3 Explicit | FB |  | CIPRead_instance(Execute, Handle, SrcDat, Size, DstDat, Done, Busy, Error, ErrorlD, ErrorIDEx, RcvSize); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Handle | Handle | Input | Handle obtained with CIPOpen instruction | --- | --- | --- |
| SrcDat | Source variable name |  | Name of variable to read in other Controller | Depends on data type. |  |  |
| Size | Number of elements to read |  | Number of elements to read | 0 to 1988 |  | 1 |
| DstDat | Read data | In-out | Read data value | Depends on data type. | --- | --- |
| RcvSize | Read data size | Output | Read data size | 0 to 1988 | Bytes | --- |

| RcvSize |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The CIPRead instruction reads the value of the network variable specified with source variable name SrcDat from another Controller on a CIP network. The other Controller is specified with Handle.
The read data value is stored in DstDat.
Size specifies the number of elements to read. If SrcDat is an array, specify the number of elements to read with Size. If SrcDat is not an array, always specify 1 for Size. If the value of Size is 0 , nothing is read regardless of whether SrcDat is an array or not.
When the read operation is completed, the number of bytes of the data that was read is assigned to read data size RcvSize. You can read a maximum of 1,988 bytes of data.
The data type of Handle is structure _sCIP_HANDLE. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Handle | Handle | Handle | _sCIP_ <br> HANDLE | --- | --- | --- |
| Handle | Handle | Handle | UDINT | Depends on <br> data type. | --- | --- |

If the value of ErrorID is WORD\#16\#1C00, the CIP message error code is stored in ErrorIDEx.
The following example reads the value of variable abc. The read data is stored in variable def and the value of variable $v w x$ changes to UINT\#1.
LD

## ST

CIPRead_instance(A, cip_h, 'abc', UINT\#1, def, ghi, jkl, mno, pqr, stu, vwx);

## Reading Arrays

To read array data, pass a subscripted array element to ScrDat as the parameter. Also pass a subscripted array element to DstDat as the parameter. The following example reads the four array variable elements $a b c[3]$ to $a b c[6]$ and stores the results in array variable elements def[10] to def[13]. The value of variable $v w x$ will be UINT\#4.

[^13]
## Related System-defined Variables

| Name | Meaning | Data <br> type | Description |
| :--- | :--- | :--- | :--- |
| _EIP_EtnOnlineSta | Online | BOOL | Status of built-in EtherNet/IP port communications <br> TRUE: Can be used. <br> FALSE: Cannot be used. |

## Additional Information

Refer to the following manuals for details on CIP communications.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CJ-series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- Execute the CIPOpen instruction to obtain the value for Handle before you execute this instruction.
- This instruction can be used only through the built-in EtherNet/IP ports on NJ-series CPU Units.
- If a variable is read from an OMRON Controller, the variable must be published to the network. Publish the variable to the network in advance.
- You cannot specify an address in memory for CJ-series Units directly to read data. To read specific addresses in memory for CJ-series Units, use an AT specification in advance to assign the memory addresses to a variable.
- You cannot specify an address in local memory for CJ-series Units directly to store data. To store data in specific addresses in memory for CJ-series Units, use an AT specification in advance to assign the memory addresses to DstDat.
- The characters that can be used in SrcDat are specified in the following table.

| Item | Specification |
| :--- | :--- |
| Maximum num- <br> ber of bytes | 127 bytes |
| Character code | UTF-8 |
| Applicable char- <br> acters | Alphanumeric characters (not case sensitive), single-byte Katakana, multibyte characters, <br> and '_' (underbars) |
| Prohibited text <br> strings | - Any text string that starts with ASCII characters 0 to 9 (character codes 16\#30 to 16\#39) <br> - A text string that consists of only a single _ (underbar) ASCII character <br> - Any text string that includes two or more consecutive_ (underbar) ASCII characters <br> - Any text string that starts with an _ (underbar) ASCII character <br> - Any text string that ends with an _ (underbar) ASCII character <br> - Any text string that starts with "P_" |

- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of Handle.Handle is outside of the valid range.
- The value of Size is outside of the valid range.
- The value of DstDat is outside of the valid range.
- The value of RcvSize is outside of the valid range.
- For this instruction, expansion error code ErrorIDEx gives the CIP message error code. The meanings are as follows:

| Value | Error |
| :--- | :--- |
| $16 \# 02000000$ | Normal communications are not possible due to a high load at the remote node. |
| $16 \# 05000000$ | The specified source variable does not exits on the other Controller. |
| $16 \# 0 C 008010$ | The specified source variable is being downloaded. |
| $16 \# 0 C 008011$ |  |
| $16 \# 11000000$ | The value of Size is exceeds the data size that can currently be read. |
| $16 \# 20008017$ | The specified source variable is not an array and the number of elements to read is not 1. |
| $16 \# 20008018$ | The specified source variable is an array and the number of elements to read exceeds the <br> number of elements in the array. |
| $16 \# 26000000$ | The specified destination variable contains only the NULL character. |

## Sample Programming

Refer to the sample programming that is provided for the CIPOpen instruction (page 2-684).

## CIPWrite

The CIPWrite instruction uses a class 3 explicit message to write the value of a variable in another Con－ troller on a CIP network．

| Instruction | Name | $\begin{aligned} & \hline \text { FB/ } \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |

| SrcDat | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK |
| Handle | An enumeration，array，structure，structure member，or union member can also be specified．＊ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

＊You cannot specify a STRING array．

## Function

The CIPWrite instruction writes the value of the network variable specified with destination variable name DstDat at another Controller on a CIP network．The other Controller is specified with Handle．The content of source data ScrDat is written．
Size specifies the number of elements to write．If DstDat is an array，specify the number of elements to write with Size．If DstDat is not an array，always specify 1 for Size．If the value of Size is 0 ，nothing is written regardless of whether DstDat is an array or not．

The data type of Handle is structure _sCIP_HANDLE. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Handle | Handle | Handle | _sCIP_ <br> HANDLE | --- | --- | --- |
| Handle | Handle | Handle | UDINT | Depends on <br> data type. | --- | --- |

If the value of ErrorID is WORD\#16\#1C00, the CIP message error code is stored in ErrorIDEx.
The following example writes variable $a b c$. The contents of variable def is written to variable $a b c$.

## Writing Arrays

To write array data, pass a subscripted array element to DstDat as the parameter. Also pass a subscripted array element to SrcDat as the parameter. The following example stores the contents of array variable elements def[10] to def[13] in the four array variable elements $a b c[3]$ to $a b c[6]$.

LD

ST

CIPWrite_instance(A, cip_h, 'abc[3]', UINT\#4, def, ghi[10], jkl, mno, pqr, stu);

## Maximum Write Data Size

The maximum size of the data that you can write depends on the data type and variable name that are specified for DstDat, as given in the following table.
Maximum write data size [bytes] = Base size - Size of variable name of DstDat

| Item in above formula | Meaning |
| :--- | :--- |
| Base size | - Data type of variable specified for DstDat is a structure or STRING: 1,986 bytes |
|  | - Other data types: 1,988 bytes |

| Item in above formula | Meaning |
| :---: | :---: |
| Size of variable name of DstDat | - The size of the variable name is calculated as the total bytes for the ASCII characters in all structure levels plus two times the number of levels. <br> - If the number of bytes of ASCII characters in a level is an odd number, add 1. <br> - If a level in the structure is an array, add four times the number of dimensions in the array. <br> - Periods and commas in the structure and arrays are not included in the variable name size. |

Example 1: When the Variable Name of DstDat Is aaa.bbbbb[1,2,3].cc

- The text string "aaa" in the first level is 3 bytes. It is an odd number, so 1 is added to make 4 bytes.
- The text string "bbbbb[1,2,3]" in the second level is 5 bytes. It is an odd number, so 1 is added to make 6 bytes.
- Also $b b b b b[1,2,3]$ is a three-dimensional array, so 3 times 4 , or 12 , is added to make 18 bytes.
- The text string "cc" in the third level is 2 bytes. It is an even number, so 2 bytes is used in the calculation.
- If we add the number of levels 3 times 2 , or 6 , to 4 bytes for the first level, 18 bytes for the second level, and 2 bytes for the third level, the size of the variable name come to 30 bytes.
Example 2: When the Variable Name of DstDat Is val
- The text string "val" in the first level is 3 bytes. It is an odd number, so 1 is added to make 4 bytes.
- If we then add the number of levels 1 times 2 , or 2 , the size of the variable name is 6 bytes.
Example 3: When the Variable Name of DstDat Is array[8].
- The text string "array" in the first level is 5 bytes. It is an odd number, so 1 is added to make 6 bytes.
- It is a one-dimensional array. Therefore, 1 times 4 , or 4 , is added.
- If we then add the number of levels 1 times 2 , or 2 , the size of the variable name is 12 bytes.

Related System-defined Variables

| Name | Meaning | Data <br> type | Description |
| :--- | :--- | :--- | :--- |
| _EIP_EtnOnlineSta | Online | BOOL | Status of built-in EtherNet/IP port communications <br> TRUE: Can be used. <br> FALSE: Cannot be used. |

## Additional Information

Refer to the following manuals for details on CIP communications.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CJ-series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- Execute the CIPOpen instruction to obtain the value for Handle before you execute this instruction.
- You can use this instruction only through a built-in EtherNet/IP port on an NJ-series CPU Unit or a port on an EtherNet/IP Unit connected to an NJ-series CPU Unit.
- If a variable is written to an OMRON Controller, the variable must be published to the network. Publish the variable to the network in advance.
- You cannot specify an address in memory for CJ-series Units directly to write data. To write specific addresses in memory for CJ-series Units, use an AT specification in advance to assign the memory addresses to a variable.
- You cannot directly specify an address in local memory for CJ-series Units. To write specific addresses in memory for CJ-series Units, use an AT specification in advance to assign the memory addresses to SrcDat.
- The characters that can be used in DstDat are specified in the following table.

| Item | Specification |
| :--- | :--- |
| Maximum num- <br> ber of bytes | 127 bytes |
| Character code | UTF-8 |
| Applicable char- <br> acters | Alphanumeric characters (not case sensitive), single-byte Katakana, multibyte characters, <br> and '_'(underbars) |
| Prohibited text <br> strings | - Any text string that starts with ASCII characters 0 to 9 (character codes 16\#30 to 16\#39) <br> - A text string that consists of only a single _ (underbar) ASCII character <br> - Any text string that includes two or more consecutive _ (underbar) ASCII characters <br> - Any text string that starts with an _ (underbar) ASCII character <br> - Any text string that ends with an _ (underbar) ASCII character <br> - Any text string that starts with "P_" |

- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of Handle.Handle is outside of the valid range.
- The value of Size is outside of the valid range.
- The value of SrcDat is outside of the valid range.
- For this instruction, expansion error code ErrorIDEx gives the CIP message error code. The meanings are as follows:

| Value | Error |
| :--- | :--- |
| $16 \# 02000000$ | Normal communications are not possible due to a high load at the remote node. |
| $16 \# 05000000$ | The specified source variable does not exits on the other Controller. |
| $16 \# 0 C 008010$ | The specified source variable is being downloaded. |
| $16 \# 0 C 008011$ | - The specified destination variable has a Constant attribute, so it cannot be written. <br> - The write data does not agree with the number of write elements. |
| $16 \# 1$ F000102 | The specified destination variable is not an array and the number of elements to write is <br> not 1. |
| $16 \# 20008017$ | The specified destination variable is an array and the number of elements to write <br> exceeds the number of elements in the array. <br> - The specified destination variable is an enumeration and the write data is not the value <br> of an enumerator. |
| $16 \# 20008028$ | - The specified destination variable has a Range Specification attribute and the write <br> data is out of range. |
| $16 \# 26000000$ | The specified destination variable contains only the NULL character. |

## Sample Programming

Refer to the sample programming that is provided for the CIPOpen instruction (page 2-684).

## CIPSend

The CIPSend instruction sends a class 3 CIP message to a specified device on a CIP network.

| Instruction | Name | $\begin{aligned} & \hline \text { FB/ } \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |

## Function

The CIPSend instruction sends service data ServiceDat for the service specified with service code Ser－ viceCode as a class 3 explicit message．
The destination is specified with handle Handle．
RqPath specifies the request path．
Size specifies the number of elements to send．If ServiceDat is an array，specify the number of ele－ ments to send with Size．If ServiceDat is not an array，always specify 1 for Size．If no service data is required，set Size to 0 ．
The response data received later is stored in RespServiceDat．The number of bytes of the response data is stored in RespSize．
The data type of Handle is structure＿sCIP＿HANDLE．The specifications are as follows：

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Handle | Handle | Handle | sCIP＿ <br> HANDLE | --- | --- | --- |
| Handle | Handle | Handle | UDINT | Depends on <br> data type． | --- | --- |

The data type of RqPath is structure＿sREQUEST＿PATH．The specifications are as follows：

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| RqPath | Request path | Request path（class ID， instance ID，attribute ID） | $\begin{aligned} & \hline \text { sREQUEST_- } \\ & \text { PATH } \end{aligned}$ | －－－ | －－－ | －－－ |
| ClassID | Class ID | Class ID | UINT | Depends on data type． | －－－ | 0 |
| InstanceID | Instance ID | Instance ID | UINT |  |  |  |
| isAttributeID | Attribute usage | TRUE：Attribute ID used． FALSE：Attribute ID not used． | BOOL |  |  | FALSE |
| AttributeID | Attribute ID | Attribute ID | UINT |  |  | 0 |

If the value of ErrorID is WORD\＃16\＃1C00，the CIP message error code is stored in ErrorIDEx．The meaning and values of ErrorIDEx depend on the remote node．Refer to the manual for the remote node．

Sending and Receiving Arrays
If ServiceDat or RespServiceDat is an array，pass a subscripted array element to it as the parameter．

## Maximum Read/Write Data Size

You can read a maximum of 1,990 bytes of data. The maximum size of the data that you can write depends on whether there is a request path attribute, as given below.
Maximum write data size [bytes] = Base size - Attribute usage

| Item in above formula | Meaning |
| :--- | :--- |
| Base size | 1,992 bytes |
| Attribute usage | Attribute ID used: 12 bytes <br>  <br>  Attribute ID not used: 8 bytes |

Related System-defined Variables

| Name | Meaning | Data <br> type | Description |
| :--- | :--- | :--- | :--- |
| _EIP_EtnOnlineSta | Online | BOOL | Status of built-in EtherNet/IP port communications <br> TRUE: Can be used. <br> FALSE: Cannot be used. |

## Additional Information

Refer to the following manuals for details on CIP communications.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CJ-series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- Execute the CIPOpen instruction to obtain the value for Handle before you execute this instruction.
- You can use this instruction only through a built-in EtherNet/IP port on an NJ-series CPU Unit or a port on an EtherNet/IP Unit connected to an NJ-series CPU Unit.
- If a variable is written to an OMRON Controller, the variable must be published to the network. Publish the variable to the network in advance.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of Handle.Handle is outside of the valid range.
- The value of ServiceCode is outside of the valid range.
- The value of a member of RqPath is outside of the valid range.
- The value of Size is outside of the valid range.

## Sample Programming

Refer to the sample programming that is provided for the CIPOpen instruction (page 2-684).

## CIPClose

The CIPClose instruction closes the CIP class 3 connection to the specified handle．

| Instruction | Name | FB／ <br> FUN | Graphic expression | ST expression |
| :--- | :--- | :--- | :---: | :--- |
| CIPClose | Close CIP <br> Class 3 Con－ <br> nection | FB | CIPClose＿instance | CIPClose＿instance（Execute， <br> Handle，Done，Busy，Error， |

[^15]
## Function

The CIPUCMMRead instruction reads the value of the network variable specified with source variable name SrcDat from another Controller on a CIP network. The other Controller is specified with route path RoutePath.
The read data value is stored in DstDat.
Size specifies the number of elements to read. If SrcDat is an array, specify the number of elements to read with Size. If SrcDat is not an array, always specify 1 for Size. If the value of Size is 0, nothing is read regardless of whether SrcDat is an array or not.
When the read operation is completed, the number of bytes of the data that was read is assigned to read data size RcvSize. You can read a maximum of 496 bytes of data.
TimeOut specifies the timeout time. If a response does not return within the timeout time, it is assumed that communications failed.
If the value of ErrorID is WORD\#16\#1C00, the CIP message error code is stored in ErrorIDEx.
The following example reads the value of variable abc. The read data is stored in variable def and the value of variable $v w x$ changes to UINT\#1.

## LD <br> ST

CIPUCMMRead_instance(A, '21192.168.250.2’,
UINT\#0, 'abc', UINT\#1, def, ghi, jkl, mno, pqr, stu, vwx);

## Reading Arrays

To read array data, pass a subscripted array element to ScrDat as the parameter. Also pass a subscripted array element to DstDat as the parameter. The following example reads the four array variable elements $a b c[3]$ to $a b c[6]$ and stores the results in array variable elements def[10] to def[13]. The value of variable $v w x$ will be UINT\#4.

## Related System-defined Variables

| Name | Meaning | Data <br> type | Description |
| :--- | :--- | :--- | :--- |
| _EIP_EtnOnlineSta | Online | BOOL | Status of built-in EtherNet/IP port communications <br> TRUE: Can be used. <br> FALSE: Cannot be used. |

## Additional Information

Refer to the following manuals for details on CIP communications.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CJ-series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only through the built-in EtherNet/IP ports on NJ-series CPU Units.
- If a variable is read from an OMRON Controller, the variable must be published to the network. Publish the variable to the network in advance.
- You cannot specify an address in memory for CJ-series Units directly to read data. To read specific addresses in memory for CJ-series Units, use an AT specification in advance to assign the memory addresses to a variable.
- You cannot specify an address in local memory for CJ-series Units directly to store data. To store data in specific addresses in memory for CJ-series Units, use an AT specification in advance to assign the memory addresses to DstDat.
- If the variable that is read is a user-defined structure, you can read a maximum of 492 bytes.
- The characters that can be used in SrcDat are specified in the following table.

| Item | Specification |
| :--- | :--- |
| Maximum num- <br> ber of bytes | 127 bytes |
| Character code | UTF-8 |
| Applicable char- <br> acters | Alphanumeric characters (not case sensitive), single-byte Katakana, multibyte characters, <br> and "_' (underbars) |
| Prohibited text <br> strings | - Any text string that starts with ASCII characters 0 to 9 (character codes 16\#30 to 16\#39) <br> - A text string that consists of only a single _ (underbar) ASCII character <br> - Any text string that includes two or more consecutive _ (underbar) ASCII characters <br> - Any text string that starts with an _ (underbar) ASCII character <br> - Any text string that ends with an _ (underbar) ASCII character <br> - Any text string that starts with "P_" |

[^16]- There is a setting error for the local IP address.
- The text string in RoutePath does not end in a NULL character.
- The value of TimeOut is outside of the valid range.
- The value of Size is outside of the valid range.
- The value of DstDat is outside of the valid range.
- The value of RcvSize is outside of the valid range.
- For this instruction, expansion error code ErrorIDEx gives the CIP message error code. The meanings are as follows:

| Value | Error |
| :---: | :--- |
| $16 \# 02000000$ | Normal communications are not possible due to a high load at the remote node. |
| $16 \# 05000000$ | The specified source variable does not exist on the other Controller. |
| $16 \# 0 C 008010$ | The specified source variable is being downloaded. |
| $16 \# 0 C 008011$ |  |
| $16 \# 11000000$ | The value of Size is exceeds the data size that can currently be read. |
| $16 \# 20008017$ | The specified source variable is not an array and the number of elements to read is not 1. |
| $16 \# 20008018$ | The specified source variable is an array and the number of elements to read exceeds the <br> number of elements in the array. |
| $16 \# 26000000$ | The specified destination variable contains only the NULL character. |

## Sample Programming

Refer to the sample programming that is provided for the CIPUCMMSend instruction (page 2-716).

## CIPUCMMWrite

The CIPUCMMWrite instruction uses a UCMM explicit message to write the value of a variable in another Controller on a CIP network.

| Instruction | Name | FB/ <br> FUN | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| CIPUCMM Write | Write Variable UCMM Explicit | FB |  | CIPUCMMWrite_instance(Execute, RoutePath, TimeOut, DstDat, Size, SrcDat, Done, Busy, Error, ErrorID, ErrorIDEx); |

## Variables

[^17]
## Function

The CIPUCMMWrite instruction writes the value of the network variable specified with destination variable name DstDat at another Controller on a CIP network. The other Controller is specified with route path RoutePath.
The content of source data ScrDat is written.
Size specifies the number of elements to write. If DstDat is an array, specify the number of elements to write with Size. If DstDat is not an array, always specify 1 for Size. If the value of Size is 0 , nothing is written regardless of whether DstDat is an array or not.
TimeOut specifies the timeout time. If a response does not return within the timeout time, it is assumed that communications failed.
If the value of ErrorID is WORD\#16\#1C00, the CIP message error code is stored in ErrorIDEx.
The following example writes variable $a b c$. The contents of variable def is written to variable $a b c$.

ST

CIPUCMMWrite_instance(A, '2\192.168.250.2’, UINT\#0, 'abc', UINT\#1, def, ghi, jkl, mno, pqr, stu);

## Writing Arrays

To write array data, pass a subscripted array element to DstDat as the parameter. Also pass a subscripted array element to SrcDat as the parameter. The following example stores the contents of array variable elements def[10] to def[13] in the four array variable elements $a b c[3]$ to $a b c[6]$.

## LD

ST

CIPUCMMWrite_instance(A, ‘2\192.168.250.2’,
UINT\#0, 'abc[3]', UINT\#4, def[10], ghi, jkl, mno, pqr, stu);

## Maximum Write Data Size

The maximum size of the data that you can write depends on the data type and variable name that are specified for DstDat and the route path, as given in the following table.
Maximum write data size [bytes] = Base size - Size of variable name of DstDat - Path information size

| Item in above formula | Meaning |
| :--- | :--- |
| Base size | - Data type of variable specified for DstDat is a structure or STRING: 494 <br> bytes <br> • Other data types: 496 bytes |

| Item in above formula | Meaning |
| :---: | :---: |
| Size of variable name of DstDat | - The size of the variable name is calculated as the total bytes for the ASCII characters in all structure levels plus two times the number of levels. <br> - If the number of bytes of ASCII characters in a level is an odd number, add 1. <br> - If a level in the structure is an array, add four times the number of dimensions in the array. <br> - Periods and commas in the structure and arrays are not included in the variable name size. <br> Example 1: When the Variable Name of DstDat Is aaa. $b b b b b[1,2,3] . c c$ <br> - The text string "aaa" in the first level is 3 bytes. It is an odd number, so 1 is added to make 4 bytes. <br> - The text string "bbbbb[1,2,3]" in the second level is 5 bytes. It is an odd number, so 1 is added to make 6 bytes. <br> - Also $b b b b b[1,2,3]$ is a three-dimensional array, so 3 times 4 , or 12 , is added to make 18 bytes. <br> - The text string "cc" in the third level is 2 bytes. It is an even number, so 2 bytes is used in the calculation. <br> - If we add the number of levels 3 times 2 , or 6 , to 4 bytes for the first level, 18 bytes for the second level, and 2 bytes for the third level, the size of the variable name come to 30 bytes. <br> Example 2: When the Variable Name of DstDat Is val <br> - The text string "val" in the first level is 3 bytes. It is an odd number, so 1 is added to make 4 bytes. <br> - If we then add the number of levels 1 times 2 , or 2 , the size of the variable name is 6 bytes. <br> Example 3: When the Variable Name of DstDat Is array[8]. <br> - The text string "array" in the first level is 5 bytes. It is an odd number, so 1 is added to make 6 bytes. <br> - It is a one-dimensional array. Therefore, 1 times 4 , or 4 , is added. <br> - If we then add the number of levels 1 times 2 , or 2 , the size of the variable name is 12 bytes. |

| Item in above formula | Meaning |
| :---: | :---: |
| Path information size | - If there are no hops, the path information size is 0 bytes.* <br> - If there are hops, the path information size is the route path size plus 12 bytes. <br> - The route path size is the bytes size of the ASCII characters in the route path. <br> - However, the following precautions apply. <br> - If the address portion starts with "\#", calculate the network and address portions as a total of 2 bytes. <br> - If the address portion does not start with "\#", calculate the network portion as 2 bytes. |

[^18]
## Related System-defined Variables

| Name | Meaning | Data <br> type | Description |
| :--- | :--- | :--- | :--- |
| _EIP_EtnOnlineSta | Online | BOOL | Status of built-in EtherNet/IP port communications <br> TRUE: Can be used. <br> FALSE: Cannot be used. |

## Additional Information

Refer to the following manuals for details on CIP communications.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- You can use this instruction only through a built-in EtherNet/IP port on an NJ-series CPU Unit or a port on an EtherNet/IP Unit connected to an NJ-series CPU Unit.
- If a variable is written to an OMRON Controller, the variable must be published to the network. Publish the variable to the network in advance.
- You cannot specify an address in memory for CJ-series Units directly to write data. To write specific addresses in memory for CJ-series Units, use an AT specification in advance to assign the memory addresses to a variable.
- You cannot directly specify an address in local memory for CJ-series Units. To write specific addresses in memory for CJ -series Units, use an AT specification in advance to assign the memory addresses to SrcDat.
- The characters that can be used in DstDat are specified in the following table.

| Item | Specification |
| :--- | :--- |
| Maximum num- <br> ber of bytes | 127 bytes |
| Character code | UTF-8 |
| Applicable char- <br> acters | Alphanumeric characters (not case sensitive), single-byte Katakana, multibyte characters, <br> and '_, (underbars) |
| Prohibited text <br> strings | - Any text string that starts with ASCII characters 0 to 9 (character codes 16\#30 to 16\#39) <br> - A text string that consists of only a single _ (underbar) ASCII character <br> - Any text string that includes two or more consecutive _ (underbar) ASCII characters <br> - Any text string that starts with an _ (underbar) ASCII character <br> - Any text string that ends with an _ (underbar) ASCII character <br> - Any text string that starts with "P_" |

- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The text string in RoutePath does not end in a NULL character.
- The value of TimeOut is outside of the valid range.
- The value of Size is outside of the valid range.
- The value of SrcDat is outside of the valid range.
- For this instruction, expansion error code ErrorIDEx gives the CIP message error code. The meanings are as follows:

| Value | Error |
| :---: | :--- |
| $16 \# 02000000$ | Normal communications are not possible due to a high load at the remote node. |
| $16 \# 05000000$ | The specified destination variable does not exist on the other Controller. |
| $16 \# 0 C 008010$ | The specified destination variable is being downloaded. |
| $16 \# 0 C 008011$ |  |
| $16 \# 1$ F000102 | The specified destination variable has a Constant attribute, so it cannot be written. |
| $16 \# 20008017$ | The specified destination variable is not an array and the number of elements to write is not 1. |
| $16 \# 20008018$ | The specified destination variable is an array and the number of elements to write exceeds the <br> number of elements in the array. |

| Value | Error |
| :---: | :--- |
| $16 \# 20008028$ | - The specified destination variable is an enumeration and the write data is not the value of an <br> enumerator. <br> - The specified destination variable has a Range Specification attribute and the write data is <br> out of range. |
| $16 \# 26000000$ | The specified destination variable name is only the NULL character. |

## Sample Programming

Refer to the sample programming that is provided for the CIPUCMMSend instruction (page 2-716).

## CIPUCMMSend

The CIPUCMMSend instruction sends a UCMM CIP message to a specified device on a CIP network．

| Instruction | Name | $\begin{aligned} & \hline \mathrm{FB} / \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |

## Function

The CIPUCMMSend instruction sends command data ServiceDat for the service specified with service code ServiceCode as a UCMM explicit message.
The destination is specified with route path RoutePath.
RqPath specifies the request path.
Size specifies the number of elements to send. If ServiceDat is an array, specify the number of elements to send with Size. If ServiceDat is not an array, always specify 1 for Size. If no service data is required, set Size to 0 .
The response data received later is stored in RespServiceDat. The number of bytes of the response data is stored in RespSize.
TimeOut specifies the timeout time. If a response does not return within the timeout time, it is assumed that communications failed.

The data type of RqPath is structure _sREQUEST_PATH. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| RqPath | Request path | Request path (class ID, instance ID, attribute ID) | $\begin{aligned} & \text { sREQUEST_ } \\ & \text { PATH } \end{aligned}$ | --- | --- | --- |
| ClassID | Class ID | Class ID | UINT | Depends on data type. | --- | 0 |
| InstancelD | Instance ID | Instance ID | UINT |  |  |  |
| isAttributelD | Attribute usage | TRUE:Attribute ID used. FALSE:Attribute ID not used. | BOOL |  |  | FALSE |
| AttributelD | Attribute ID | Attribute ID | UINT |  |  | 0 |

If the value of ErrorID is WORD\#16\#1C00, the CIP message error code is stored in ErrorIDEx. The meaning and values of ErrorIDEx depend on the remote node. Refer to the manual for the remote node.

## Sending and Receiving Arrays

If ServiceDat or RespServiceDat is an array, pass a subscripted array element to it as the parameter.

## Maximum Read/Write Data Size

You can read a maximum of 492 bytes of data. The maximum size of the data that you can write depends on whether there is a request path attribute and the route path that is used, as given below.
Maximum write data size [bytes] = Base size - Attribute usage - Path information size

| Item in above formula | Meaning |
| :--- | :--- |
| Base size | 500 bytes |
| Attribute usage | Attribute ID used: 12 bytes <br>  Attribute ID not used: 8 bytes |

| Item in above formula | Meaning |
| :---: | :---: |
| Path information size | - If there are no hops, the path information size is 0 bytes.* <br> - If there are hops, the path information size is the route path size plus 12 bytes. <br> - The route path size is the bytes size of the ASCII characters in the route path. <br> - However, the following precautions apply. <br> - If the address portion starts with "\#", calculate the network and address portions as a total of 2 bytes. |

- If the address portion does not start with "\#", calculate the network portion as 2 bytes.
- If the address portion does not start with "\#" and the number of bytes in the ASCII characters for the address portion is an odd number, add 1 byte.
- Do not include the level separator, "", between levels of the route path in the route path size.
- Do not include the first hop in the route path size.

Example 1: When the Route Path Is 01<br>\#11\02\192.168.250.2\01<br>\#01

- The first hop in the route path size is not included, so ignore '01<br>\#11' at the start of the path.
- The network type is ' 02 ', so use 2 bytes in the calculation.
- The address portion is '192.168.250.2', so use 13 bytes in the calculation. It is an odd number, so 1 is added to make 14 bytes.
- For the following '01<br>\#01', the address portion starts with "\#", so the network and address portions are calculated as a total of 2 bytes.
- If you add all of the above sizes, the size of the route path is 18 bytes.
- If we then add 12 bytes to the route path size, the path information size is 30 bytes.
Example 2: When the Route Path Is 02\192.168.250.2\01<br>\#00
- The first hop in the route path size is not included, so ignore '02\192.168.250.2' at the start of the path.
- For the following '01\#01', the address portion starts with "\#", so the network and address portions are calculated as a total of 2 bytes.
- Therefore, the size of the route path is 2 bytes.
- If we then add 12 bytes to the route path size, the path information size is 14 bytes.
Example 3: When the Route Path Is 02\192.168.250.2
- If there are no hops, the path information size is 0 bytes.

[^19]
## Related System-defined Variables

| Name | Meaning | Data <br> type | Description |
| :--- | :--- | :--- | :--- |
| _EIP_EtnOnlineSta | Online | BOOL | Status of built-in EtherNet/IP port communications <br> TRUE: Can be used. <br> FALSE: Cannot be used. |

## Additional Information

Refer to the following manuals for details on CIP communications.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CJ-series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- You can use this instruction only through a built-in EtherNet/IP port on an NJ-series CPU Unit or a port on an EtherNet/IP Unit connected to an NJ-series CPU Unit.
- If a variable is written to an OMRON Controller, the variable must be published to the network. Publish the variable to the network in advance.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The text string in RoutePath does not end in a NULL character.
- The value of TimeOut is outside of the valid range.
- The value of ServiceCode is outside of the valid range.
- The value of a member of RqPath is outside of the valid range.
- The value of Size is outside of the valid range.

## Sample Programming

This sample uses CIP UCMM messages to write a variable, read a variable, and send a message. The Controllers are connected to an EtherNet/IP network. The IP address of the remote node is 192.168.250.2.

The following procedure is used.
1 The CIPUCMMWrite instruction is used to write the value of a variable at a remote node. The variable name at the remote node is WritingDat and the contents of the WriteDat is written to it. WritingDat must be defined as a global variable at the remote node and the Network Publish attribute must be set.

2 The CIPUCMMRead instruction is used to read the value of a variable at a remote node. The value of the variable OriginalDat at the other node is read and the read value is stored in the ReadDat variable. OriginalDat must be defined as a global variable at the remote node and the Network Publish attribute must be set.
3 The CIPUCMMSend instruction is used to send an explicit message to a remote node. The contents of the message is to read identity information (product name). The class ID, instance ID, attribute ID, and service code are as follows: The response data is stored in the ResDat variable.

| Item | Value |
| :--- | :--- |
| Class ID | 1 |
| Instance ID | 1 |
| Attribute ID | 7 |
| Service code | $16 \# 0 \mathrm{E}$ |

essage sent to read identity information (product name).

| AbortCode |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The EC_CoESDOWrite instruction writes data to the CoE object of the node specified with slave node address NodeAdr. The content of WriteDat is written to the object. The number of bytes of data to write is specified with WriteSize. The SDO parameter is specified with SdoObj.
The data type of SdoObj is structure _sSDO_ACCESS. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SdoObj | SDO <br> parameter | SDO parameter | _sSDO- | --- | --- | --- |
| Index | Index | Index number in the object dictionary defined in CoE | UINT | 1 to 65535 |  |  |
| Subindex | Subindex | Subindex number in the object dictionary defined in CoE | USINT |  |  |  |
| IsCompleteAccess | Complete access | Specification of complete access of SDO <br> TRUE: Access data for all subindexes <br> FALSE: Access data for the specified subindex | BOOL | Depends on data type. | --- | --- |

After the write is completed, the instruction waits for the response for the time specified with timeout time TimeOut. The response is stored in AbortCode. AbortCode is 0 for a normal response. A value is stored in AbortCode only when the value of ErrorID is 16\#1804 (SDO abort response).
The meaning and values of AbortCode depend on the slave. Refer to the manual for the slave.
The following figure shows a timing chart. A value is stored in AbortCode when Busy changes to FALSE after the completion of instruction processing.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _EC_MBXSlavTbl[i] | Message Communica- <br> tions Enabled Slave <br> Th the node address. <br> Table | BOOL | This variable indicates when communications are <br> possible for each slave. |
|  |  |  | TRUE: Communications are possible. <br> FALSE: Communications are not possible. |

## Additional Information

- Refer to the NJ-series CPU Unit Built-in EtherCAT Port User's Manual (Cat. No. W505) for details on EtherCAT communications.
- Refer to A-4 SDO Abort Codes on page A-47 for the SDO abort codes.

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the NJ-series EtherCAT ports.
- An error occurs in the following cases. Error will change to TRUE.
- The EtherCAT master is not in a state that allows message communications.
- The slave specified with NodeAdr does not exist.
- The slave specified with NodeAdr is not in a state that allows communications.
- The slave returns an error response.

## EC＿CoESDORead

The EC＿CoESDORead instruction reads a value from a CoE＊object of a specified slave on an Ether－ CAT network．

## Function

The EC_CoESDORead instruction reads data from the CoE object of the node specified with slave node address NodeAdr. The read data is stored in ReadDat. Then size of data that was stored is stored in ReadSize. The value of ReadSize is valid only when the data was stored successfully.
The SDO parameter is specified with SdoObj.
The data type of SdoObj is structure _sSDO_ACCESS. The specifications are as follows:

| Name | Meaning | Description | Data type | Valid range | Unit | Default |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SdoObj | SDO parameter | SDO parameter | $\begin{aligned} & \text { ssSDO- } \\ & \text { ACCESS } \end{aligned}$ | --- | --- | --- |
| Index | Index | Index number in the object dictionary defined in CoE | UINT | 1 to 65535 |  |  |
| Subindex | Subindex | Subindex number in the object dictionary defined in CoE | USINT |  |  |  |
| IsCompleteAccess | Complete access | Specification of complete access of SDO <br> TRUE:Access data for all subindexes <br> FALSE:Access data for the specified subindex | BOOL | Depends on data type. | --- | --- |

After the read is completed, the instruction waits for the response for the time specified with timeout time TimeOut. The response is stored in AbortCode. AbortCode is 0 for a normal response. A value is stored in AbortCode only when the value of ErrorID is 16\#1804 (SDO abort response).
The meaning and values of AbortCode depend on the slave. Refer to the manual for the slave.
The following figure shows a timing chart. A value is stored in AbortCode when Busy changes to FALSE after the completion of instruction processing.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _EC_MBXSlaveTbl[i] | Message Communica- <br> "i is the node address. | BOOL <br> tions Enabled Slave <br> Table |  |

## Additional Information

- Refer to the NJ-series CPU Unit Built-in EtherCAT Port User's Manual (Cat. No. W505) for details on EtherCAT communications.
- Refer to A-4 SDO Abort Codes on page A-47 for the SDO abort codes.

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the NJ-series EtherCAT ports.
- An error occurs in the following cases. Error will change to TRUE.
- The EtherCAT master is not in a state that allows message communications.
- The slave specified with NodeAdr does not exist.
- The slave specified with NodeAdr is not in a state that allows communications.
- The slave returns an error response.
- The read data size is larger than the size of ReadDat.

## Sample Programming

This sample uses an EtherCAT SDO message to read the software version of an OMRON V1.02 R88D-KN01L-ECT Servo Drive. The node address of the slave is 1 .
The object index for the software version is 16\#100A. The subindex is 0 . The read value is stored in STRING variable VersionInfo.

## EC_StartMon

The EC_StartMon instruction starts execution of packet monitoring for EtherCAT communications.

| Instruction | Name | FB/ <br> FUN | Graphic expression | ST expression |
| :--- | :---: | :---: | :---: | :--- |
| EC_StartMon | Start EtherCAT <br> Facket Monitor | FB | EC_StartMon_instance | EC_SatrtMon_instance(Execute, Done, <br> Busy, Error, ErrorlD); |

## Variables

Only common variables are used.

## Function

The EC_StartMon instruction starts execution of packet monitoring for EtherCAT communications. The packet monitor function collects a specified number of the most recent EtherCAT communications packets. When the specified number of packets is exceeded, old packets are discarded in order. After the EC_StartMon instruction is executed, packet monitoring continues until the EC_StopMon instruction is executed.

Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _EC_PktMonStop | Packet Monitoring <br> Stopped | BOOL | This variable shows if packet monitoring is stopped. <br> TRUE: Stopped. <br> FALSE: Not stopped. |
| _EC_PktSaving | Saving Packet Data <br> File | BOOL | This variable shows if the instruction is saving packet <br> data in an internal file in the main memory of the CPU <br> Unit. <br> TRUE: Saving. <br> FALSE: Not saving. |

## Additional Information

- You cannot save collected packet data in an internal file of the main memory of the CPU Unit during ECATStartMonitor execution.
- Do the following to save packet data in an internal file in the main memory of the CPU Unit: First, execute the EC_StopMon instruction to stop packet monitoring. Then execute the EC_SaveMon instruction to save the packets.
- Refer to the NJ -series CPU Unit Built-in EtherCAT Port User's Manual (Cat. No. W505) for details on EtherCAT communications.

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the NJ -series EtherCAT ports.
- An error occurs in the following case. Error will change to TRUE.
- A packet data save operation to an internal file in the main memory of the CPU Unit is in progress.

## Sample Programming

This sample transfers EtherCAT communications packets to an SD Memory Card when an EtherCAT slave error occurs. The file name is 'PacketFile.' The processing procedure is as follows:

1 The system-defined variable _EC_ErrSta (EtherCAT Error) is monitored and processing is started if an error occurs.
2 The EC_StopMon instruction is used to stop execution of packet monitoring for EtherCAT communications.
3 The EC_SaveMon instruction is used to save EtherCAT communications packet data to an internal file in the main memory of the CPU Unit.
4 The EC_CopyMon instruction is used to copy that file to the SD Memory Card.
5 The EC_StartMon instruction is used to restart execution of packet monitoring for EtherCAT communications.

## EC_StopMon

The EC_StopMon instruction stops execution of packet monitoring for EtherCAT communications.

| Instruction | Name | $\begin{aligned} & \text { FB/ } \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| EC_StopMon | Stop EtherCAT Packet Monitor | FB | EC_StopMon_instance  <br> EC_StopMon  <br> Execute Done <br>  Busy <br>  Error <br>  Errorld <br>  - <br>   | EC_StopMon_instance(Execute, Done, Busy, Error, ErrorlD); |

## Variables

Only common variables are used.

## Function

The EC_StopMon instruction stops execution of packet monitoring for EtherCAT communications. The packet monitor function collects a specified number of the most recent EtherCAT communications packets.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _EC_PktMonStop | Packet Monitoring <br> Stopped | BOOL | This variable shows if packet monitoring is stopped. <br> TRUE: Stopped. <br> FALSE: Not stopped. |
| _EC_PktSaving | Saving Packet Data <br> File | BOOL | This variable shows if the instruction is saving packet <br> data in an internal file in the main memory of the CPU <br> Unit. <br> TRUE: Saving. <br> FALSE: Not saving. |

## Additional Information

- Do the following to save collected packet data in an internal file in the main memory of the CPU Unit: First, stop packet monitoring. Then execute the EC_SaveMon instruction to save the packets.
- Refer to the NJ -series CPU Unit Built-in EtherCAT Port User's Manual (Cat. No. W505) for details on EtherCAT communications.

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the NJ-series EtherCAT ports.
- An error occurs in the following case. Error will change to TRUE.
- Packet monitoring is already stopped.

## Sample Programming

Refer to the sample programming that is provided for the EC_StartMon instruction (page 2-734).

## EC_SaveMon

The EC_SaveMon instruction saves EtherCAT communications packet data to an internal file in the main memory of the CPU Unit.

| Instruction | Name | $\begin{aligned} & \text { FB/ } \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| EC_SaveMon | Save EtherCAT Packets | FB |  | EC_SaveMon_instance(Execute, Done, Busy, Error, ErrorID); |

## Variables

Only common variables are used.

## Function

The EC_SaveMon instruction saves EtherCAT communications packet data that was collected by the packet monitoring function to an internal file in the main memory of the CPU Unit. The packet monitor function collects a specified number of the most recent EtherCAT communications packets.

## Related System-defined Variables

| Name | Meaning | Data type | Description |
| :--- | :--- | :--- | :--- |
| _EC_PktMonStop | Packet Monitoring <br> Stopped | BOOL | This variable shows if packet monitoring is stopped. <br> TRUE: Stopped. <br> FALSE: Not stopped. |

## Additional Information

- You cannot execute packet monitoring while this instruction is in execution.
- Refer to the NJ-series CPU Unit Built-in EtherCAT Port User's Manual (Cat. No. W505) for details on EtherCAT communications.

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the NJ-series EtherCAT ports.
- You cannot execute this instruction while packet monitoring is in progress. Execute the EC_StopMon instruction in advance to stop packet monitoring.
- An error occurs in the following case. Error will change to TRUE.
- Packet monitoring is in progress.

## Sample Programming

Refer to the sample programming that is provided for the EC_StartMon instruction (page 2-734).

## EC_CopyMon

The EC_CopyMon instruction transfers packet data in an internal file in the main memory of the CPU Unit to a SD Memory Card.

| Instruction | Name | $\begin{aligned} & \hline \text { FB/ } \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| EC_CopyMon | Transfer EtherCAT Packets | FB |  | EC_CopyMon_instance(Execute, FileName, Done, Busy, Error, ErrorID); |

## Variables

| Name | Meaning | I/O | Description | Valid range | Unit | Default |
| :---: | :---: | :---: | :--- | :--- | :--- | :--- |
| FileName | File name | Input | File name on the SD Memory <br> Card | Depends on data <br> type. | --- | -- |

## Function

The EC_CopyMon instruction transfers packet data in an internal file in the main memory of the CPU Unit to a SD Memory Card. FileName specifies the file name on the SD Memory Card.

Related System-defined Variables

| Name | Meaning | Data type | Description |
| :---: | :--- | :--- | :--- |
| _EC_PktSaving | Saving Packet Data <br> File | BOOL | This variable shows if the instruction is saving packet <br> data in an internal file in the main memory of the CPU <br> Unit. |
|  |  |  | TRUE: Saving. <br> FALSE: Not saving. |

## Additional Information

Refer to the NJ-series CPU Unit Built-in EtherCAT Port User's Manual (Cat. No. W505) for details on EtherCAT communications.

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the NJ-series EtherCAT ports.
- You cannot execute this instruction while a packet save operation is in progress.
- To use this instruction, execute the EC_SaveMon instruction in advance to save the packet data in an internal file in the main memory of the CPU Unit.
- An error occurs in the following case. Error will change to TRUE.
- A packet data file save operation is in progress.

## Sample Programming

Refer to the sample programming that is provided for the EC_StartMon instruction (page 2-734).

## EC＿DisconnectSlave

The EC＿DisconnectSlave instruction disconnects the specified slave from the network．

| Instruction | Name | $\begin{aligned} & \hline \text { FB/ } \\ & \text { FUN } \end{aligned}$ | Graphic expression | ST expression |
| :---: | :---: | :---: | :---: | :---: |
| EC＿Disconnect Slave | Disconnect EtherCAT Slave | FB |  | EC＿DisconnectSlave＿instance（Execute， NodeAdr，Done，Busy，Error，ErrorID）； |

| NodeAdr |  |  |  |  |  |  | OK |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Function

The EC＿DisconnectSlave instruction disconnects the slave specified with slave node address NodeAdr from the EtherCAT network．
Here，disconnection from the network means that the slave is placed in a state in which it does not operate even though it still exists on the network．

## Related System－defined Variables

| Name | Meaning | Data type | Description |

| ＿EC＿DisableSlavTb［i］ ＂ i ＂is the node address． | Disabled Slave Table | BOOL［］ | This variable shows if slaves are disabled on the network． <br> TRUE：Disabled． <br> FALSE：Not disabled． |

## Additional Information

Refer to the NJ-series CPU Unit Built-in EtherCAT Port User's Manual (Cat. No. W505) for details on EtherCAT communications.

## Precautions for Correct Use

- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the NJ-series EtherCAT ports.
- If there are slaves with daisy-chain connections (i.e., connected to the output port) after the disconnected slave, they are disconnected from the EtherCAT network also.
- An error occurs in the following case. Error will change to TRUE.
- The slave specified with NodeAdr is not part of the EtherCAT network. That is, the value of _EC_EntrySlavTbli] (Network Connected Slave Table) is FALSE.
- The slave specified with NodeAdr is disabled.

## Sample Programming

This sample disconnects slave 1 from the EtherCAT network and then connects it again. When Trigger 1 changes to TRUE, the EC_DisconnectSlave instruction is executed to disconnect slave 1. When Trigger 2 changes to TRUE, the EC_ConnectSlave instruction is executed to connect slave 1 again.

\section*{Function}

The EC＿ConnectSlave instruction connects the slave specified with slave node address NodeAdr to the EtherCAT network．
Here，connection to the network means that the slave exists on the network and it is placed in a state in which it operates．

\end{tabular}

\section*{Additional Information}

Refer to the NJ －series CPU Unit Built－in EtherCAT Port User＇s Manual（Cat．No．W505）for details on EtherCAT communications．

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the NJ -series EtherCAT ports.
- An error occurs in the following cases. Error will change to TRUE.
- The slave specified with NodeAdr is not part of the EtherCAT network. That is, the value of _EC_EntrySlavTbl[i] (Network Connected Slave Table) is FALSE.
- The slave specified with NodeAdr is not disconnected from the network.

\section*{Sample Programming}

Refer to the sample programming that is provided for the EC_DisconnectSlave instruction (page 2-746).

\section*{SktUDPCreate}

The SktUDPCreate instruction creates a UDP socket request to open a servo port for the built－in Ether－ Net／IP．

\section*{Function}

The SktUDPCreate instruction opens the port specified with the local UDP port number ScrUdpPort．To do this，it executes the Socket（）and Bind（）socket functions．Information on the socket that is opened is stored in Socket．The UDP port is open when the instruction is completed normally（i．e．，when the value of Done changes to TRUE）．

The data type of Socket is structure _sSOCKET. The specifications are as follows:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Name & Meaning & Description & Data type & Valid range & Unit & Default \\
\hline Socket & Socket & Socket & _sSOCKET & --- & --- & --- \\
\hline Handle & Handle & Handle for data communications & UDINT & Depends on data type. & --- & --- \\

\end{tabular} \\
\hline
\end{tabular}

\section*{Additional Information}

Refer to the NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506) for details on socket services.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the built-in EtherNet/IP on NJ-series CPU Units.
- This instruction must be used in ST. It cannot be used in a ladder diagram.
- Use the SktClose instruction to close handles that are created with this instruction.
- Handles that are created with this instruction are disabled when you change to PROGRAM mode.
- You can execute a maximum of 32 of the following instructions at the same time: SktUDPCreate, SktUDPRcv, SktUDPSend, SktTCPAccept, SktTCPConnect, SktTCPRcv, SktTCPSend, SktGetTCPStatus, SktClose, and SktClearBuf.
- You can open a maximum of 16 sockets combined for UDP and TCP sockets.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of SrcUdpPort is outside of the valid range.
- The port that is specified with SrcUdpPort is already open or close processing is in progress for it.
- The port that is specified with ScrUdpPort is already in use.

\section*{Sample Programming}

In this sample, the UDP socket service is used for data communications between the NJ -series Controller and a remote node.

The processing procedure is as follows:
1 The SktUDPCreate instruction is used to request creating a UDP socket.
2 The SktUDPSend instruction is used to request sending data. The data in SendSocketDat[] is sent.
3 The SktUDPRcv instruction is used to request receiving data. The received data is stored in RcvSocketDat[].
4 The SktClose instruction is used to close the socket.

\section*{- Programming in the Remote Node}

In this example, programming is also required in the remote node. The order of sending and receiving is reversed in comparison with the above procedure.
1
The skuloprcreate instruction is used to request creating a UPP socket.
2 The SktUDPRcv instruction is used to request receiving data. The received data is stored in RcvSocketDat[].
3 The SktUDPSend instruction is used to request sending data. The data in SendSocketDat[] is sent.
4 The SktClose instruction is used to close the socket.

\section*{Function}

The SktUDPRcv instruction stores the data in the receive buffer for the socket that is specified with Socket in receive data RcvDat［］．The number of bytes to store is specified with Size．The number of bytes that is actually stored is assigned to RcvSize．The node address of the node that sent the data is stored in SendNodeAdr．
If there is no data in the receive buffer，the instruction waits for data for the time that is set with timeout time TimeOut．Storage of the data to RcvDat［］is completed when the instruction is completed normally （i．e．，when the value of Done changes to TRUE）．

The data type of Socket is structure _sSOCKET. The specifications are as follows:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Name & Meaning & Description & Data type & Valid range & Unit & Default \\
\hline Socket & Socket & Socket & _sSOCKET & --- & --- & --- \\
\hline Handle & Handle & Handle for data communications & UDINT & Depends on data type. & --- & --- \\

\end{tabular}

\section*{Additional Information}

Refer to the NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506) for details on socket services.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the built-in EtherNet/IP on NJ-series CPU Units.
- This instruction must be used in ST. It cannot be used in a ladder diagram.
- Up to 2,000 bytes of data can be read from the receive buffer with one instruction.
- If the size of data that was received by the specified socket is smaller than the value of Size, then all of the received data is stored in RecDat[]. Then size of data that was stored is stored in RcvSize.
- If the size of data that was received by the specified socket is larger than the value of Size, then the size of received data specified by Size is stored in RecDat[].
- The receive data is not read if the value of Size is 0 .
- If the SktClose instruction closes the connection when there is no data in the receive buffer, a normal end occurs without waiting to receive data even if a timeout has not occurred. The value of RcvSize is 0 in that case.
- You can execute a maximum of 32 of the following instructions at the same time: SktUDPCreate, SktUDPRcv, SktUDPSend, SktTCPAccept, SktTCPConnect, SktTCPRcv, SktTCPSend, SktGetTCPStatus, SktClose, and SktClearBuf.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- Data reception is in progress for the socket specified with Socket.
- The socket specified with Socket is not open.
- The handle specified by Socket.Handle does not exist.

\section*{Sample Programming}

Refer to the sample programming that is provided for the SktUDPCreate instruction (page 2-754).

\section*{SktUDPSend}

The SktUDPSend instruction sends data from a UDP port for the built－in EtherNet／IP．

\section*{Additional Information}

Refer to the NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506) for details on socket services.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the built-in EtherNet/IP on NJ-series CPU Units.
- This instruction must be used in ST. It cannot be used in a ladder diagram.
- Up to 2,000 bytes of data can be sent with one instruction. A maximum of 2,000 bytes is sent even if the SendDat[] array is larger than 2,000 bytes. Only 1,472 bytes can be sent if the broadcast address is specified.
- If the value of Size is 0 , then 0 bytes of send data is transmitted on the line.
- You can execute a maximum of 32 of the following instructions at the same time: SktUDPCreate, SktUDPRcv, SktUDPSend, SktTCPAccept, SktTCPConnect, SktTCPRcv, SktTCPSend, SktGetTCPStatus, SktClose, and SktClearBuf.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of a member of Socket is outside of the valid range.
- Data transmission is in progress for the socket specified with Socket.
- The socket specified with Socket is not open.
- The remote node for Socket was specified with a domain name and address resolution failed.
- The handle specified by Socket.Handle does not exist.
- The value of Size exceeds the number of elements in SendDat[].

\section*{Sample Programming}

Refer to the sample programming that is provided for the SktUDPCreate instruction (page 2-754).

\section*{Function}

The SktTCPAccept instruction requests accepting the port specified with the local TCP port number ScrTcpPort．To do this，it executes the Socket（），Bind（），Listen（），and Accept（）socket functions．The instruction waits for the time set with timeout time TimeOut for a connection to be established with the remote node．The connection is established when the instruction is completed normally（i．e．，when the value of Done changes to TRUE）．

The data type of Socket is structure _sSOCKET. The specifications are as follows:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Name & Meaning & Description & Data type & Valid range & Unit & Default \\
\hline Socket & Socket & Socket & _sSOCKET & --- & --- & --- \\
\hline Handle & Handle & Handle for data communications & UDINT & Depends on data type. & --- & --- \\
\hline SrcAdr* & Local address & Local IP address and port number & \[

\end{tabular}

\section*{Additional Information}
- Refer to the NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506) for details on socket services.
- You can execute this instruction more than once to open connections to more than one client with one local port number. A different socket is returned for each connection.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the built-in EtherNet/IP on NJ-series CPU Units.
- This instruction must be used in ST. It cannot be used in a ladder diagram.
- Use the SktClose instruction to close handles that are created with this instruction.
- Handles that are created with this instruction are disabled when you change to PROGRAM mode.
- You can execute a maximum of 32 of the following instructions at the same time: SktUDPCreate, SktUDPRcv, SktUDPSend, SktTCPAccept, SktTCPConnect, SktTCPRcv, SktTCPSend, SktGetTCPStatus, SktClose, and SktClearBuf.
- You can open a maximum of 16 sockets combined for UDP and TCP sockets.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of SrcTcpPort is outside of the valid range.
- Open processing is in progress for the socket specified with SrcTcpPort.
- Close processing is in progress for the socket specified with SrcTcpPort.
- A connection is not opened within the time that is specified with TimeOut.

\section*{Sample Programming}

Refer to the sample programming that is provided for the SktTCPConnect instruction (page 2-770).

\section*{Function}

The SktTCPConnect instruction requests a connection between local TCP port number SrcTcpPort and destination TCP port number DstTcpPort at destination address DstAdr. To do this, it executes the Connect() socket function. The connection is established when the instruction is completed normally (i.e., when the value of Done changes to TRUE).
The data type of Socket is structure _sSOCKET. The specifications are as follows:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Name & Meaning & Description & Data type & Valid range & Unit & Default \\
\hline Socket & Socket & Socket & _sSOCKET & --- & --- & --- \\

Refer to the NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506) for details on socket services.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the built-in EtherNet/IP on NJ-series CPU Units.
- This instruction must be used in ST. It cannot be used in a ladder diagram.
- Use the SktClose instruction to close handles that are created with this instruction.
- Handles that are created with this instruction are disabled when you change to PROGRAM mode.
- You can execute a maximum of 32 of the following instructions at the same time: SktUDPCreate, SktUDPRcv, SktUDPSend, SktTCPAccept, SktTCPConnect, SktTCPRcv, SktTCPSend, SktGetTCPStatus, SktClose, and SktClearBuf.
- You can open a maximum of 16 sockets combined for UDP and TCP sockets.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of \(D s t A d r\) is outside of the valid range.
- The value of \(\operatorname{DstTcpPort~is~outside~of~the~valid~range.~}\)
- The TCP port that is specified with SrcTcpPort is already open.
- The remote node that is specified with DstAdr does not exist.
- The remote node that is specified with DstAdr and DstTcpPort is not waiting for a connection.
- Address resolution failed for the host name that is specified with DstAdr.
- A connection is already open for the same client (IP address and TCP port).

\section*{Sample Programming}

In this sample, the TCP socket service is used for data communications between the NJ-series Controller and a remote node.

The processing procedure is as follows:
1 The SktTCPConnect instruction is used to request connecting to the TCP port on the remote node.
2 The SktClearBuf instruction is used to clear the receive buffer for a TCP socket.
3 The SktGetTCPStatus instruction is used to read the status of a TCP socket.
4 The SktTCPSend instruction is used to request sending data. The data in SendSocketDat[] is sent.
5 The SktTCPRcv instruction is used to request receiving data. The received data is stored in RcvSocketDat[].
6 The SktClose instruction is used to close the socket.

\section*{- Programming in the Remote Node}

In this example, programming is also required in the remote node. The order of sending and receiving is reversed in comparison with the above procedure.
1
The SktTCPAccept instruction is used to request accepting a TCP socket.
2 The SktTCPRcv instruction is used to request receiving data. The received data is stored in RcvSocketDat[].
3 The SktTCPSend instruction is used to request sending data. The data in SendSocketDat[] is sent.

4 The SktClose instruction is used to close the socket.

\section*{Function}

The SktTCPRcv instruction stores the data in the receive buffer for the socket that is specified with Socket in receive data RcvDat [] . The number of bytes to store is specified with Size. The number of bytes that is actually stored is assigned to RcvSize. If there is no data in the receive buffer, the instruction waits for data for the time that is set with timeout time TimeOut. Storage of the data to RcvDat[] is completed when the instruction is completed normally (i.e., when the value of Done changes to TRUE).

The data type of Socket is structure _sSOCKET. The specifications are as follows:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Name & Meaning & Description & Data type & Valid range & Unit & Default \\
\hline Socket & Socket & Socket & _sSOCKET & --- & --- & --- \\
\hline Handle & Handle & Handle for data communications & UDINT & Depends on data type. & --- & --- \\

\end{tabular} \\
\hline
\end{tabular}

\section*{Additional Information}

Refer to the NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506) for details on socket services.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the built-in EtherNet/IP on NJ-series CPU Units.
- This instruction must be used in ST. It cannot be used in a ladder diagram.
- Up to 2,000 bytes of data can be read with one instruction. A maximum of 2,000 bytes is read even if the RcvDat[] array is larger than 2,000 bytes.
- If the size of data that was received by the specified socket is smaller than the value of Size, then all of the received data is stored in RecDat[]. Then size of data that was stored is stored in RcvSize.
- If the size of data that was received by the specified socket is larger than the value of Size, then the size of received data specified by Size is stored in RecDat[].
- The receive data is not read if the value of Size is 0 .
- If the SktClose instruction closes the connection when there is no data in the receive buffer, an error end occurs even if a timeout has not occurred.
- You can execute a maximum of 32 of the following instructions at the same time: SktUDPCreate, SktUDPRcv, SktUDPSend, SktTCPAccept, SktTCPConnect, SktTCPRcv, SktTCPSend, SktGetTCPStatus, SktClose, and SktClearBuf.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of a member of Socket is outside of the valid range.
- Data reception is in progress for the socket specified with Socket.
- The socket specified with Socket is not connected.
- The handle specified by Socket.Handle does not exist.
- Data was not received before the time that is specified with TimeOut expired.
- The socket was closed with the SktClose instruction.

\section*{Sample Programming}

Refer to the sample programming that is provided for the SktTCPConnect instruction (page 2-770).

\section*{SktTCPSend}

The SktTCPSend instruction sends data from a TCP port for the built-in EtherNet/IP.
\begin{tabular}{l|l|l|l|l}

\hline
\end{tabular}

\section*{Function}

The SktGetTCPStatus instruction gets the TCP connection status TcpStatus of the socket that is specified with Socket. If there is receive data in the receive buffer, the value of data received flag DatRecvFlag changes to TRUE. Storage of the data to TcpStatus and DatRcvFlag is completed when the instruction is completed normally (i.e., when the value of Done changes to TRUE).
The data type of Socket is structure _sSOCKET. The specifications are as follows:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Name & Meaning & Description & Data type & Valid range & Unit & Default \\
\hline Socket & Socket & Socket & _sSOCKET & --- & --- & --- \\
\hline Handle & Handle & Handle for data communications & UDINT & Depends on data type. & --- & --- \\

\end{tabular}

\section*{Function}

The SktClose instruction closes the socket that is specified with Socket．If a TCP socket is specified，the socket is disconnected before it is closed．If the socket handle Socket．Handle is 0，all TCP and UDP ports that currently use the socket service are closed．Close processing for the TCPUDP sockets is completed when the instruction is completed normally（i．e．，when the value of Done changes to TRUE）．

The data type of Socket is structure _sSOCKET. The specifications are as follows:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Name & Meaning & Description & Data type & Valid range & Unit & Default \\
\hline Socket & Socket & Socket & _sSOCKET & --- & --- & --- \\
\hline Handle & Handle & \begin{tabular}{l}
Handle of the connection to close. \\
0 : Closes all TCP connections that currently use the socket service.
\end{tabular} & UDINT & Depends on data type. & --- & --- \\

\end{tabular}

\section*{Additional Information}

Refer to the NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506) for details on socket services.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction can be used only for the built-in EtherNet/IP on NJ-series CPU Units.
- This instruction must be used in ST. It cannot be used in a ladder diagram.
- If the SktUDPRcv or SktTCPRcv instruction is executed and then the SktClose instruction is executed while the socket for the specified handle is on standby to received data, the standby status is canceled.
- If more than one connection is open for the same local port number, only the connection for the specified socket is closed.
- If the value of the socket handle Socket. Handle is 0 , all connections that are on standby for the SktTCPAccept instruction are canceled.
- You can execute a maximum of 32 of the following instructions at the same time: SktUDPCreate, SktUDPRcv, SktUDPSend, SktTCPAccept, SktTCPConnect, SktTCPRcv, SktTCPSend, SktGetTCPStatus, SktClose, and SktClearBuf.
- An error occurs in the following cases. Error will change to TRUE.
- There is a setting error for the local IP address.
- The value of a member of Socket is outside of the valid range.
- The handle specified by Socket.Handle does not exist.

\section*{Sample Programming}

Refer to the sample programming for the following instructions: SktUDPCreate (page 2-754) and SktTCPConnect (page 2-770).

\section*{SktClearBuf}

The SktClearBuf instruction clears the receive buffer for the specified TCP or UDP socket for the built－in EtherNet／IP．

\end{tabular}

\section*{Function}

The FileWriteVar instruction writes the value of variable WriteVar to the file specified by FileName in the SD Memory Card．The value is written in binary format．You can specify an enumeration，array，array element，structure，or structure member for WriteVar．
If a file with the name FileName does not exist on the SD Memory Card，it is created．FileName includes the path．If a specified directory does not exist in the SD Memory Card，it is created．
If a file with the name FileName already exists in the SD Memory Card，the following processing is per－ formed depending on the value of overwrite enable OverWrite．
\begin{tabular}{l|l}
\hline \multicolumn{1}{c|}{ Value of OverWrite } & \multicolumn{1}{c}{ Processing } \\
\hline TRUE（Enable overwrite．） & The existing file is overwritten． \\
\hline FALSE（Prohibit overwrite．） & The file is not overwritten and an error occurs． \\
\hline
\end{tabular}

The following figure shows a programming example. The contents of array variable \(a b c[0]\) is written to a file named 'Templf_name.bin.'

Related System-defined Variables

Power Interruption Flag
\end{tabular} & BOOL & \begin{tabular}{l} 
This flag indicates if an error occurred in completing \\
processing when power was interrupted during SD \\
Memory Card access. This flag is not cleared automat- \\
ically. \\
TRUE: Error. \\
FALSE: No error.
\end{tabular} \\
\hline
\end{tabular}

\section*{Additional Information}

The root directory of the file name is the top level of the SD Memory Card.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- If the specified file is larger than the size of WriteVar, an error does not occur and only data that corresponds to the size of WriteVar is written. Once this instruction is executed, the specified file is reduced to the size of WriteVar.
- Data is written in byte increments. The lower bytes are written before the upper bytes (little endian).
- If WriteVar is a structure, adjustment areas between members may be inserted depending on the composition.
- An error occurs in the following cases. Error will change to TRUE.
- The SD Memory Card is not in a usable condition.
- The SD Memory Card is write protected.
- There is insufficient space available on the SD Memory Card.
- The value of FileName is not a valid file name.
- The maximum number of files or directories is exceeded.
- A file with the name FileName already exits and the file is being accessed.
- A file with the name FileName already exits and the value of OverWrite is FALSE.
- A file with the name FileName already exits and the file is write protected.
- If more than four SD Memory Card instructions that do not have a FileID variable (i.e., FileWriteVar, FileReadVar, FileCopy, DirCreate, FileRemove, DirRemove, and FileRename) are executed at the same time.
- The value of FileName exceeds the maximum number of bytes allowed in a file name.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

This sample writes all of array variable Var1[] to the file 'File1.dat.'

\section*{Function}

The FileReadVar instruction reads the contents of the file specified by FileName from the SD Memory Card as binary data．The contents that is read is assigned to variable to write ReadVar．You can specify an enumeration，array，array element，structure，or structure member for ReadVar．
The following figure shows a programming example．Here，the contents of the file called
＇Temp／f＿name．bin＇is read and written to the array variable \(a b c[]\) ．

LD

ST

FileReadVar＿instance（A，＇Temp／f＿name．bin＇，abc， def，ghi，jkl，mno）；

\section*{Related System-defined Variables}
\begin{tabular}{l|l|l|l}
\hline \multicolumn{1}{c|}{ Name } & \multicolumn{1}{|c|}{ Meaning } & \multicolumn{1}{c|}{ Data type } & \multicolumn{1}{c}{ Description } \\
\hline _Card1Ready & \begin{tabular}{l} 
SD Memory Card \\
Ready Flag
\end{tabular} & BOOL & \begin{tabular}{l} 
This flag indicates if the SD Memory Card is physically \\
inserted and is mounted normally, i.e., if it can be accessed \\
by instructions and communications commands. \\
TRUE: Can be used. \\
FALSE: Cannot be used.
\end{tabular} \\
\hline _Card1Protect & \begin{tabular}{l}

when it is inserted and ready to use. \\
TRUE: Write protected. \\
FALSE: Not write protected.
\end{tabular} \\
\hline _Card1Err & \begin{tabular}{l} 
SD Memory Card Error \\
Flag
\end{tabular} & BOOL & \begin{tabular}{l} 
This flag indicates if an unspecified SD Memory Card (e.g., \\
an SDHC card) is mounted or if the format is incorrect (i.e., \\
not FAT16 or corrupted). \\
TRUE: Error.
\end{tabular} \\
\hline FALSE: No error.
\end{tabular}

\section*{Additional Information}

The root directory of the file name is the top level of the SD Memory Card.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- If the specified file is larger than the size of ReadVar, an error does not occur and only data that corresponds to the size of ReadVar is read.
- If the specified file is smaller than the size of ReadVar, an error does not occur and only data that corresponds to the size of the specified file is read. The remaining area in ReadVar will retain the values from before execution of this instruction.
- Data is read in byte increments. The lower bytes are read before the upper bytes (little endian).
- If ReadVar is a structure, adjustment areas between members may be inserted depending on the composition.
- An error occurs in the following cases. Error will change to TRUE.
- The SD Memory Card is not in a usable condition.
- The file specified by FileName does not exist.
- The value of FileName is not a valid file name.
- The file specified by FileName is being accessed.
- If more than four SD Memory Card instructions that do not have a FilelD variable (i.e., FileWriteVar, FileReadVar, FileCopy, DirCreate, FileRemove, DirRemove, and FileRename) are executed at the same time.
- The value of FileName exceeds the maximum number of bytes allowed in a file name.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

This sample reads the contents of the file 'File1.dat' and stores it in array variable Var1.

\section*{Function}

The FileOpen instruction opens the file specified by FileName in the SD Memory Card in the mode specified by Mode．The result is output to file ID FileID．FileID is used to specify the file in other instruc－ tions，such as FileRead and FileWrite．
The data type of Mode is enumerated type＿eFOPEN＿MODE．The meanings of the enumerators are as follows：
\begin{tabular}{c|l}
\hline \multicolumn{1}{c|}{ Enumerator } & \multicolumn{1}{c}{ Meaning } \\
\hline ＿READ＿EXIST & Use this value to open a text file to read it．The file is read from the beginning． \\
\hline ＿RDWR＿EXIST & \begin{tabular}{l} 
Use this value to open a file to read and write it．The file is read and written from the \\
beginning．
\end{tabular} \\
\hline ＿WRITE＿CREATE & \begin{tabular}{l} 
Use this value to open a file to write it．If the file already exists，the contents is dis－ \\
carded and the file size is set to 0．If the file does not exist，a new file is created．The \\
file is written from the beginning．However，if the file already exists and it is write－pro－ \\
tected，an error occurs and the file is not opened．
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{c|l}
\hline Enumerator & \multicolumn{1}{c}{ Meaning } \\
\hline _RDWR_CREATE & \begin{tabular}{l} 
Use this value to open a file to read and write it. If the file already exists, the contents \\
is discarded and the file size is set to 0 . If the file does not exist, a new file is created. \\
The file is read and written from the beginning.
\end{tabular} \\
\hline _WRITE_APPEND & \begin{tabular}{l} 
Use this value to open a file to append data to it. If the file does not exist, a new file is \\
created. The data is appended to the end of the file. However, if the file already exists \\
and it is write-protected, an error occurs and the file is not opened.
\end{tabular} \\
\hline _RDWR_APPEND & \begin{tabular}{l} 
Use this value to open a file to read and append data to it. If the file does not exist, a \\
new file is created. The file is read from the beginning. The data is appended to the \\
end of the file.
\end{tabular} \\
\hline
\end{tabular}

The following figure shows a programming example. The file named 'Temp/f_name' is opened to append data to it. The file ID is assigned to variable mno.

\section*{LD}

\end{tabular},

\section*{Additional Information}

The root directory of the file name is the top level of the SD Memory Card.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- This instruction must be executed before any of the following instructions: FileSeek, FileRead, FileWrite, FileGets, and FilePuts.
- You must use the FileClose instruction to close any file that is opened with this instruction after you finish using it.
- A value is stored in FileID when the instruction is completed. Specifically, it is stored when the value of Done changes from FALSE to TRUE.
- If a file is open when the operating mode of the CPU Unit is changed to PROGRAM mode or when a major fault level Controller error occurs, the file is closed by the system. Any read/write operations that are in progress are completed to the end.
- If a file is open when the power supply it stopped with the power switch, the file is not corrupted. The file, however, will remain open. Use the FileClose instruction to close the file.
- If a file is open and the SD Memory Card is removed before the power switch is pressed, the contents of the file will sometimes be corrupted. Always turn OFF the power supply before removing the SD Memory Card.
- If a file is open and the SD Memory Card is removed before the power switch is pressed, the file will remain open. Use the FileClose instruction to close the file.
- If a file is open when the power supply is stopped or the SD Memory Card is removed, the file will remain open, but it will not be possible to read or write the file even if the SD Memory Card is inserted again. To read/write the file, close the file and then open it again.
- An error occurs in the following cases. Error will change to TRUE.
- The SD Memory Card is not in a usable condition.
- The SD Memory Card is write protected.
- The value of Mode is _READ_EXIST or _RDWR_EXIST and the file specified with FileName does not exist.
- The value of FileName is not a valid file name.
- The maximum number of files or directories is exceeded.
- The file specified by FileName is being accessed.
- The file specified by FileName is write protected.
- An attempt was made to open more than five files at the same time.
- The value of FileName exceeds the maximum number of bytes allowed in a file name.
- An error that prevents access occurs during SD Memory Card access.
- The value of Mode is outside of the valid range.

\section*{Sample Programming}

Refer to the sample programming for the following instructions: FileRead (page 2-812), FileWrite (page 2-819), FileGets (page 2-826), and FilePuts (page 2-833).

\section*{FileClose}

The FileClose instruction closes the specified file in the SD Memory Card.
\begin{tabular}{|c|c|c|c|c|}
\hline Instruction & Name & FB/FUN & Graphic expression & ST expression \\
\hline FileClose & Close File & FB &  & FileClose_instance(Execute, FileID, Done, Busy, Error, ErrorlD); \\
\hline
\end{tabular}

\hline
\end{tabular}

\section*{Additional Information}

You must open files with the FileOpen instruction for the following instructions: FileSeek, FileRead, FileWrite, FileGets, and FilePuts.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- You must use the FileOpen instruction in advance to obtain the value for FileID.
- You must use this instruction to close any file that is opened with the FileOpen instruction after you finish using it.
- If a file is open when the operating mode of the CPU Unit is changed to PROGRAM mode or when a major fault level Controller error occurs, the file is closed by the system. Any read/write operations that are in progress are completed to the end.
- If a file is open when the power supply it stopped with the power switch, the file is not corrupted. The file, however, will remain open. Use the FileClose instruction to close the file.
- If a file is open and the SD Memory Card is removed before the power switch is pressed, the contents of the file will sometimes be corrupted. Always turn OFF the power supply before removing the SD Memory Card.
- If a file is open and the SD Memory Card is removed before the power switch is pressed, the file will remain open. Use the FileClose instruction to close the file.
- If a file is open when the power supply is stopped or the SD Memory Card is removed, the file will remain open, but it will not be possible to read or write the file even if the SD Memory Card is inserted again. To read/write the file, close the file and then open it again.
- An error occurs in the following cases. Error will change to TRUE.
- The file specified by FileID does not exist.
- The file specified by FileID is already closed.
- The file specified by FileID is being accessed.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

Refer to the sample programming for the following instructions: FileRead (page 2-812), FileWrite (page \(2-819\) ), FileGets (page 2-826), and FilePuts (page 2-833).

\section*{FileSeek}

The FileSeek instruction sets a file position indicator in the specified file in the SD Memory Card.

\section*{Function}

The FileSeek instruction sets a file position indicator in the file specified by file ID FileID in the SD Memory Card. A file position indicator is the position in a file at which to start reading or writing when an instruction such as the FileRead or FileWrite instruction is executed. For example, to read from the beginning of a file, set a file position indicator at the beginning of the file with the FileSeek instruction, and then execute the FileRead instruction. The file position indicator is set at offset Offset from reference position Origin.
The data type of Origin is enumerated type _eFSEEK_ORIGIN. The meanings of the enumerators are as follows:
\begin{tabular}{c|l}
\hline Enumerator & \multicolumn{1}{c}{ Meaning } \\
\hline _SEEK_SET & Beginning of file \\
\hline _SEEK_CUR & Location of current file position indicator \\
\hline _SEEK_END & End of file \\
\hline
\end{tabular}

The following figure shows a programming example. A file position indicator is set at 100 bytes from the beginning of the file.

LD

ST

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- You must use the FileOpen instruction to obtain the value for FileID before you execute this instruction.
- An error occurs in the following cases. Error will change to TRUE.
- The value of Origin is outside of the valid range.
- The SD Memory Card is not in a usable condition.
- The file specified by FileID does not exist.
- The file specified by FileID is being accessed.
- The position specified by Origin and Offset exceeds the file size.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

Refer to the sample programming for the following instructions: FileRead (page 2-812) and FileWrite (page 2-819).

\section*{FileRead}

The FileRead instruction reads the data from the specified file in the SD Memory Card．

\section*{Function}

The FileRead instruction reads the data from position of the file position indicator in the file specified by file ID FileID in the SD Memory Card. It then stores the data in read buffer ReadBuf[]. The file position indicator is set at the desired location in advance with the FileSeek instruction. The amount of data that is read is the size of the data type of ReadBuf[] times Size. You can specify an array of enumerations or structures for ReadBuf[]. The actual number of elements that were read is stored in ReadSize. Normally, Size and ReadSize will have the same values. If the amount of data from the file position indicator to the end of the file is smaller than Size, an error will not occur and the data to the end of the file is stored in ReadBuf[]. If that occurs, the value of ReadSize will be smaller than the value of Size. If data is read to the end of the file, end of file EOF changes to TRUE. Otherwise, the value of EOF will be FALSE.

The following figure shows a programming example. If the read buffer def[] is a BYTE array, 100 bytes of data is read from the file.

\end{tabular}

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- If the data is read to the end of the file and the size of the data is not evenly divisible by the size of the data type of ReadBuf[], the data that is insufficient for the data size of ReadBuf[] is discarded. The file position indicator advances to the end of the file, and the value of EOF changes to TRUE.
- Elements beyond Size times ReadBuf[] (i.e., the elements not overwritten when data is read) will retain the values from before execution of this instruction.
- You must use the FileOpen instruction to obtain the value for FileID before you execute this instruction.
- A value is stored in EOF when the instruction is completed. Specifically, it is stored when the value of Done changes from FALSE to TRUE.
- If ReadBuf[] is an array of structures, adjustment areas between members may be inserted depending on the composition.
- If the operating mode of the CPU Unit is changed to PROGRAM mode or when a major fault level Controller error occurs during instruction execution, the file is closed by the system. Any read/write operations that are in progress are completed to the end.
- An error occurs in the following cases. Error will change to TRUE.
- The number of array elements in ReadBuf[] is smaller than the value of Size.
- The SD Memory Card is not in a usable condition.
- The file specified by FileID does not exist.
- The file specified by FileID is being accessed.
- The file specified by FileID was not opened in a reading mode.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

In this sample, four bytes of data are read from the second byte from beginning of the file named 'ABC.bin.' The data is written to BYTE array variable InDat[]. The processing procedure is as follows:
1
The FileOpen instruction is used to open the file 'ABC.bin.'
2 The FileSeek instruction is used to set a file position indicator at the second byte from the beginning of the file.

3 The FileRead instruction is used to read four bytes of data from the position of the file position indicator and store it in array variable InDat [] .

4 The FileClose instruction is used to close the file 'ABC.bin.'

FALSE: Do not delete.
\end{tabular} & Depends on data type. & --- & FALSE \\
\hline Out & Read text string & & Text string that was read & & & \\
\hline EOF & End of file & Output & \begin{tabular}{l}
Whether end of file was reached \\
TRUE: Reached. \\
FALSE: Not reached.
\end{tabular} & Depends on data type. & --- & --- \\
\hline
\end{tabular}

\section*{Function}

The FileGets instruction reads a text string of one line from the file position indicator in the file specified by file ID FileID in the SD Memory Card. The file position indicator is set at the desired location in advance with the FileSeek instruction. Line endings are determined by a line feed code. The text string that is read is written to read text string Out. The following three line feeds are automatically detected: CR, LF, and CR+LF. If line feed designation TrimLF is TRUE, the line feed code is deleted from the text string before it is written to Out. If data is read to the end of the file, end of file EOF changes to TRUE. Otherwise, the value of EOF will be FALSE.

The following figure shows a programming example. Here, a text string of one line is read from a file, the line feed code is deleted, and the result is written to pqr.

\hline Access Flag Card & BOOL & \begin{tabular}{l} 
This flag indicates if the SD Memory Card is \\
currently being accessed. \\
TRUE: Being accessed.
\end{tabular} \\
FALSE: Not being accessed.
\end{tabular}

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- If the length of the one-line text string exceeds 1,986 bytes (with UTF-8 character codes, including the final NULL character), the first 1,985 bytes of the text string are stored in Out with a NULL character attached.
- You must use the FileOpen instruction to obtain the value for FileID before you execute this instruction.
- If the operating mode of the CPU Unit is changed to PROGRAM mode or when a major fault level Controller error occurs during instruction execution, the file is closed by the system. Any read/write operations that are in progress are completed to the end.
- An error occurs in the following cases. Error will change to TRUE.
- The SD Memory Card is not in a usable condition.
- The file specified by FileID does not exist.
- The file specified by FileID is being accessed.
- The file specified by FileID was not opened in a reading mode.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

Here, multiple text strings that are separated by CR codes are stored in a file named 'ABC.csv.' All of them are text strings of numbers. One line at a time is read from the file, the text strings are converted to integers, and the results are stored in INT array variable InDat[]. Processing is ended when all of the data to the end of the file is read.
It is assumed that this sample programming is in a periodic task.

The processing procedure is as follows:
1 The FileOpen instruction is used to open the file 'ABC.csv.'
2 The FileGets instruction is used to read one line from the file.
3 The STRING_TO_INT instruction is used to convert the text string that was read to an integer and store it in InDat[].

4 Steps 2 and 3 are repeated until the EOF (end of file).
5 The FileClose instruction is used to close the file.

\section*{Additional Information}

To create a line feed after you write the text sting, add a line feed code to the end of \(I n\).

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- You must use the FileOpen instruction to obtain the value for FileID before you execute this instruction.
- If the operating mode of the CPU Unit is changed to PROGRAM mode or when a major fault level Controller error occurs during instruction execution, the file is closed by the system. Any read/write operations that are in progress are completed to the end.
- An error occurs in the following cases. Error will change to TRUE.
- The SD Memory Card is not in a usable condition.
- The SD Memory Card is write protected.
- There is insufficient space available on the SD Memory Card.
- The file specified by FileID does not exist.
- The file specified by FileID is being accessed.
- The file specified by FileID was not opened in a writing mode.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

Here, 100 lines of the contents of INT array variable Dat[0..9,0..99] are stored in a file named 'ABC.csv' in CSV file format. Each line contains ten text strings of numbers. Commas are inserted between them. A CR+LF code is added to the end of the line. The procedure is as follows:

1 One element of Dat[] is converted to one text string and stored in the STRING variable Temp.
2 Except at the end of a line, a comma is added to the end of Temp. At the end of the line, a CR+LF code is added to the end of Temp. These are joined in the STRING variable StrDat.

3 When the end of the line is reached, StrDat is written to the file.
4 Steps 1 to 3 are repeated for 100 lines.
INT array

Commas are added between text strings, a CR code is added to the end, and the results are joined.

The line is written to the file when the end of the line is reached.
‘ABC.csv’ file

FALSE: No error.
\end{tabular} \\
\hline
\end{tabular}

\section*{Additional Information}

The root directory of the file name is the top level of the SD Memory Card.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- If the copy operation fails, the file specified by DstFileName may remain in an incomplete state in the SD Memory Card.
- If a file is open when the operating mode of the CPU Unit is changed to PROGRAM mode or when a major fault level Controller error occurs, the file is closed by the system. Any read/write operations that are in progress are completed to the end.
- If a file is open when the power supply it stopped with the power switch, the file is not corrupted.
- If a file is open and the SD Memory Card is removed before the power switch is pressed, the contents of the file will sometimes be corrupted. Always turn OFF the power supply before removing the SD Memory Card.
- If a file is open when the power supply is stopped or the SD Memory Card is removed, it will not be possible to read or write the file even if the SD Memory Card is inserted again.
- An error occurs in the following cases. Error will change to TRUE.
- The SD Memory Card is not in a usable condition.
- The SD Memory Card is write protected.
- There is insufficient space available on the SD Memory Card.
- The file specified by SrcFileName does not exist.
- The value of SrcFileName is not a valid file name.
- The value of DstFileName is not a valid file name.
- The maximum number of files or directories is exceeded.
- The file specified by SrcFileName or DstFileName is already being accessed.
- A file with the name DstFileName already exits and the value of OverWrite is FALSE.
- A file with the name DstFileName already exits and the file is write protected.
- If more than four SD Memory Card instructions that do not have a FileID variable (i.e., FileWriteVar, FileReadVar, FileCopy, DirCreate, FileRemove, DirRemove, and FileRename) are executed at the same time.
- The value of DstFileName exceeds the maximum number of bytes allowed in a file name.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

The following procedure is used to move a file.
1 The DirCreate instruction is used to create a directory called 'Dir1' in the SD Memory Card.
2 The FileCopy instruction is used to copy the file named 'ABC.bin' in the existing directory 'Dir0' to the directory 'Dir1.'

3 The DirRemove instruction is used to delete the directory 'Dir0' (the source of the copy).
1. Create directory.

> 'Dir1'

2. Copy file.

3. Delete directory.

'Dir1'
ABC.bin

\end{tabular} \\
\hline
\end{tabular}

\section*{Additional Information}

The root directory of the file name is the top level of the SD Memory Card.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- If a file is open when the operating mode of the CPU Unit is changed to PROGRAM mode or when a major fault level Controller error occurs, the file is closed by the system. Any read/write operations that are in progress are completed to the end.
- If a file is open when the power supply it stopped with the power switch, the file is not corrupted.
- If a file is open and the SD Memory Card is removed before the power switch is pressed, the contents of the file will sometimes be corrupted. Always turn OFF the power supply before removing the SD Memory Card.
- If a file is open when the power supply is stopped or the SD Memory Card is removed, it will not be possible to read or write the file even if the SD Memory Card is inserted again.
- An error occurs in the following cases. Error will change to TRUE.
- The SD Memory Card is not in a usable condition.
- The SD Memory Card is write protected.
- There is insufficient space available on the SD Memory Card.
- The maximum number of directories is exceeded.
- The directory specified by DirName already exists.
- If more than four SD Memory Card instructions that do not have a FileID variable (i.e., FileWriteVar, FileReadVar, FileCopy, DirCreate, FileRemove, DirRemove, and FileRename) are executed at the same time.
- The value of DirName is not a valid directory name.
- The value of DirName exceeds the maximum number of characters allowed in a directory name.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

Refer to the sample programming that is provided for the FileCopy instruction (page 2-840).

\section*{DirRemove}

The DirRemove instruction deletes the specified directory from the SD Memory Card．

\section*{Function}

The DirRemove instruction deletes the directory with the name specified by directory to delete Dir from the SD Memory Card．
If there are files or subdirectories in the specified directory，the following processing is performed according to the value of all designation All．
\begin{tabular}{l|l}
\hline \multicolumn{1}{c|}{ Value of All } & \multicolumn{1}{c}{ Treatment } \\
\hline TRUE & All files and subdirectories are deleted along with the specified directory． \\
\hline FALSE & The specified directory is not deleted and an error occurs． \\
\hline
\end{tabular}

The following figure shows a programming example. Here, a directory named 'Dir1' is deleted.

FALSE: No error.
\end{tabular} \\
\hline
\end{tabular}

\section*{Additional Information}

The root directory of the file name is the top level of the SD Memory Card.

\section*{Precautions for Correct Use}
- Execution of this instruction is continued until processing is completed even if the value of Execute changes to FALSE or the execution time exceeds the task period. The value of Done changes to TRUE when processing is completed. Use this to confirm normal completion of processing.
- Refer to Using this Section on page 2-2 for a timing chart for Execute, Done, Busy, and Error.
- If a file is open when the operating mode of the CPU Unit is changed to PROGRAM mode or when a major fault level Controller error occurs, the file is closed by the system. Any read/write operations that are in progress are completed to the end.
- If a file is open when the power supply it stopped with the power switch, the file is not corrupted.
- If a file is open and the SD Memory Card is removed before the power switch is pressed, the contents of the file will sometimes be corrupted. Always turn OFF the power supply before removing the SD Memory Card.
- If a file is open when the power supply is stopped or the SD Memory Card is removed, it will not be possible to read or write the file even if the SD Memory Card is inserted again.
- If the directory that is specified with DirName is write protected, an error occurs and the directory is not deleted. However, any files or directories that are not write-protected inside that directory are deleted.
- An error occurs in the following cases. Error will change to TRUE.
- The SD Memory Card is not in a usable condition.
- The SD Memory Card is write protected.
- If the value of \(A l l\) is TRUE and the directory specified with DirName is being accessed by another instruction.
- If the value of \(A l l\) is FALSE and the directory specified with DirName contains a file or directory.
- The directory specified by DirName is write-protected.
- The directory that is specified with DirName contains write-protected files or write-protected directories.
- If more than four SD Memory Card instructions that do not have a FileID variable (i.e., FileWriteVar, FileReadVar, FileCopy, DirCreate, FileRemove, DirRemove, and FileRename) are executed at the same time.
- The directory specified by DirName does not exist.
- The value of DirName exceeds the maximum number of characters allowed in a directory name.
- An error that prevents access occurs during SD Memory Card access.

\section*{Sample Programming}

Refer to the sample programming that is provided for the FileCopy instruction (page 2-840).

\section*{Function}

A ReadNbit＿＊＊instruction reads the values of the upper Size bits from read position Pos in source bit string In．It assigns the values to read result Out．
The name of the instruction is determined by the data types of In and Out．For example，if In and Out are the WORD data type，the instruction is ReadNbit＿WORD．

The following example shows the ReadNbit_BYTE instruction when In is BYTE\#16\#89, Pos is USINT\#2 and Size is USINT\#4.

\section*{Additional Information}

Use a WriteNbit_** instruction to write zero or more bits to a bit string.

\section*{Precautions for Correct Use}
- The data types of In and Out must be the same.
- If the value of Size is 0 , the value of Out is \(16 \# 0\).
- An error occurs in the following cases. ENO will be FALSE, and Out will not change.
- The value of Size is outside of the valid range.
- The value of Pos is outside of the valid range.
- The bit string in In does not have enough bits for the number of bits specified by Size from the position specified by Pos.

\section*{WriteNbit_**}

The WriteNbit_** instructions write zero or more bits to a bit string.
\begin{tabular}{|c|c|c|c|c|}
\hline Instruction & Name & FB/FUN & Graphic expression & ST expression \\
\hline WriteNbit_** & N-bit Write Group & FUN &  & \begin{tabular}{l}
WriteNbit_**(In, Pos, Size, InOut); \\
must be a bit string data type.
\end{tabular} \\
\hline
\end{tabular}

\section*{Variables}

\hline InOut & \multicolumn{20}{|c|}{Must be same data type as In} \\
\hline Out & OK & & & & & & & & & & & & & & & & & & & \\
\hline
\end{tabular}

\section*{Function}

A WriteNbit_** instruction first reads the lower Size bits from read source \(I n\). Then it writes the values that it read to write position Pos in write target InOut.
The name of the instruction is determined by the data types of In and Out. For example, if In and Out are the WORD data type, the instruction is WriteNbit_WORD.

The following example shows the WriteNbit_BYTE instruction when In is BYTE\#16\#89, Pos is USINT\#2 and Size is USINT\#4.

\section*{Additional Information}

Use a ReadNbit_** instruction to read zero or more bits from a bit string.

\section*{Precautions for Correct Use}
- The data types of In and InOut must be the same.
- The value of InOut does not change if the value of Size is 0 .
- Return value Out is not used when the instruction is used in ST.
- An error occurs in the following cases. ENO will be FALSE, and InOut will not change.
- The value of Size is outside of the valid range.
- The value of Pos is outside of the valid range.
- The bit string in InOut does not have enough bits for the number of bits specified by Size from the position specified by Pos.

\section*{ChkRange}

The ChkRange instruction determines if the value of a variable is within the valid range of the range type specification．
\begin{tabular}{|c|c|c|c|c|c|}
\hline Instruction & Name & FB／FUN & Graphic expr & sion & ST expression \\
\hline ChkRange & Check Subrange Variable & FUN & \begin{tabular}{rl}

& \text { m } \\
& \text { r }
\end{aligned}
\] & \[
\stackrel{-1}{\overline{3}}
\] & \[
\begin{aligned}
& \text { 另 } \\
& \text { 恧 }
\end{aligned}
\] & 음 & 먹 & 第 \\
\hline In & & & & & & OK & OK & OK & OK & OK & OK & OK & OK & & & & & & & \\
\hline Val & \multicolumn{20}{|c|}{The basic data type that is the basis for the range specification must be the same as In．} \\
\hline Out & OK & & & & & & & & & & & & & & & & & & & \\
\hline
\end{tabular}

\section*{Function}

The ChkRange instruction determines if the value of variable to check In is within the valid range of the range specification variable Val．If the value is within the valid range，check result Out is TRUE．If the value is not within the valid range，check result Out is FALSE．

\section*{Additional Information}

You can define the range type specification for integer variables（USINT，UINT，UDINT，ULINT，SINT， INT，DINT，and LINT）．

\section*{Precautions for Correct Use}
- If \(I n\) is not a range specification variable, the value of Out changes to FALSE.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.

\section*{Sample Programming}

Here, the result of addition \(i\) is checked to see if it is within the valid range (10 to 99) of the range specification variable \(x\). If it is not within the valid range, the value of variable Correct is assigned to variable \(x\).
LD
\begin{tabular}{|l|l|l|}
\hline Variable & Data type & Comment \\
\hline\(i\) & INT & 0 \\
\hline abc & INT & 0 \\
\hline def & INT & 0 \\
\hline\(x\) & INT(10..99) & 10 \\
\hline Correct & INT & 0 \\
\hline
\end{tabular}

\section*{Function}

The GetMyTaskStatus reads the status of the current task．The task status includes the last task execu－ tion time LastExecTime，maximum task execution time MaxExecTime，minimum task execution time MinExecTime，task execution count ExecCount，task period exceeded flag Exceeded，and task period exceeded count ExceedCount．

\section*{Additional Information}

MaxExecTime，MinExecTime，ExecCount，and ExceedCount are reset at the following times．
－When operation is started
－When a reset operation is executed from the Task Execution Time Monitoring Pane of the Sysmac Studio．

\section*{Precautions for Correct Use}
－When the value of ExecCount or ExceedCount exceeds the maximum value of UDINT data （4，294，967，295），it returns to 0 ．
－Return value Out is not used when the instruction is used in ST．

\section*{Sample Programming}

In this sample，the GetMyTaskStatus reads the status of the current task．If the previous task execution time exceeds \(400 \mu \mathrm{~s}\)（ 400000 ns ），the value of the Warning variable changes to TRUE．

LD

\hline
\end{tabular}

\section*{Function}

The Task＿IsActive instruction determines if the task specified with TaskName is currently in execution or on standby．＂On standby＂means that a high－priority task was started after this task was started，so processing has been interrupted．
If it is being executed or on standby，the value of judgment Out is TRUE．If it is not being executed，the value of Out is FALSE．

\section*{Precautions for Correct Use}
－You cannot use a variable to which a text string was assigned for TaskName．Directly specify a text string．
－If this instruction is used in a ladder diagram，the value of Out changes to FALSE if an error occurs in the previous instruction on the rung．
－An error occurs in the following case．The value of Out does not change．
－The task specified with TaskName does not exist．

\section*{Sample Programming}

In this sample, the instruction determines whether periodic task Tc2 is active when the value of variable \(A\) changes to TRUE. If it is active, the value of variable \(B\) changes to TRUE.

LD
\begin{tabular}{|l|l|l|l|}
\hline Variable & Data type & \begin{tabular}{c}

value
\end{tabular} & Comment \\
\hline A & BOOL & False & \\
\hline B & BOOL & False & \\
\hline Tc2_Run & BOOL & False & Task Tc2 execution status \\
\hline
\end{tabular}

IF ( \(\mathrm{A}=\) TRUE) THEN
// Determine task status.
Tc2_Run:=Task_isActive('Tc2');
// Make variable \(B\) TRUE if Tc2 is running.
IF (Tc2_Run=TRUE) THEN B := TRUE;
END_IF;
END_IF;

\section*{Lock and Unlock}

Lock: Starts an exclusive lock between tasks. Execution of any other task with a lock region with the same lock number is disabled.
Unlock: Stops an exclusive lock between tasks.
\begin{tabular}{|c|c|c|c|c|}
\hline Instruction & Name & FB/FUN & Graphic expression & ST expression \\
\hline Lock & Lock Tasks & FUN & \begin{tabular}{ll} 
& \(\begin{array}{ll}\text { (@)Lock } \\
\text { EN } \\
\text { Index } \\
\text { ENO }\end{array}\) \\
\hline
\end{tabular} & Lock(Index); \\
\hline Unlock & Unlock Tasks & FUN &  & Unlock(Index); \\
\hline
\end{tabular}

\section*{Variables}
\begin{tabular}{l|l|l|l|l|l|l}
\hline \multicolumn{1}{c|}{ Name } & Meaning & \multicolumn{1}{c|}{ I/O } & \multicolumn{1}{c|}{ Description } & \multicolumn{1}{c|}{ Valid range } & Unit & Default \\
\hline Index & \begin{tabular}{l} 
Lock num- \\
ber
\end{tabular} & Input & Lock number & Depends on data type. & --- & 0 \\
\hline Out & \begin{tabular}{l} 
Return \\
value
\end{tabular} & Output & Always TRUE & TRUE only & --- & --- \\
\hline
\end{tabular}

\section*{Function}

The Lock and Unlock instructions create lock regions. If a lock region in one task is being executed, the lock regions with the same lock number in other tasks are not executed. Specify the lock number with Index.
The following figure shows a programming example.
Both task T1 and task T2 contain a lock region with Index set to 1. If the Lock instruction in T2 is executed first, the lock region in T1 is not executed until the Unlock instruction is executed in T2.

When the Unlock instruction is executed in T2, execution of T1 is started again, and execution of T2 is interrupted.
Lock regions with different values for Index do not affect each other.

\section*{Additional Information}
- The Lock and Unlock instructions are used when the same data is read/written from more than one task. They are used to prevent other tasks from reading/writing the data while a certain task is reading/writing the data.
- As long as the Index values are different, more than one pair of Lock and Unlock instructions can be placed in the same POU. The instruction pairs can also be nested.

\section*{Precautions for Correct Use}
- Do not make lock regions any longer than necessary. If the lock region is too long, the task execution period may be exceeded.
- Always use the Lock and Unlock instructions together as a set in the same section of the same POU.
- You can set a maximum of \(16,777,215\) lock regions at the same time.
- If Lock instructions are used in more than one task, a deadlock may occur if they are positioned poorly. A Task Execution Timeout Error will occur if there is a deadlock and a total stop is performed.

T2 executes a Lock instruction with an Index value of 1.
Therefore, execution of T2 is interrupted until the Unlock instruction is executed in T1.
- An error occurs in the following case. The value of Out does not change.
- There are more than \(16,777,215\) lock region at the same time.

\section*{Sample Programming}

Here, program P1 in task T1 and program P2 in task T2 both access the same global variable GTable1. When the value of write request WriteReq changes to TRUE, P1 writes one record to record array GTable1.Record[] and increments GTable1.Index. When read request ReadReq changes to TRUE, P2 decrements GTable1.Index and reads one record from GTable1.Record[].
The Lock instruction is used so that reading and writing do not occur at the same time.

Definition of Global Variable GTable
Data type
\begin{tabular}{l|l|l}

\section*{Get**CIk}

The Get**CIk instruction outputs a clock pulse at the specified cycle.
\begin{tabular}{|c|c|c|c|c|}
\hline Instruction & Name & FB/FUN & Graphic expression & ST expression \\
\hline Get** \({ }^{\text {tik }}\) & Get Clock Pulse Group & FUN & "**" must be 100 us, \(1 \mathrm{~ms}, 10 \mathrm{~ms}, 20 \mathrm{~ms}\), \(100 \mathrm{~ms}, 1 \mathrm{~s}\), or 1 min . & \begin{tabular}{l}
Out:=Get \({ }^{\star \star} \mathrm{Clk}()\); \\
"**" must be 100 us, 1 ms , \(10 \mathrm{~ms}, 20 \mathrm{~ms}, 100 \mathrm{~ms}, 1 \mathrm{~s}\), or 1 min .
\end{tabular} \\
\hline
\end{tabular}

\section*{Variables}
\begin{tabular}{l|c|c|l|l|l|l}
\hline \multicolumn{1}{c|}{ Name } & Meaning & I/O & \multicolumn{1}{c|}{ Description } & Valid range & Unit & Default \\
\hline Out & Clock pulse & Output & Clock pulse & Depends on data type. & --- & --- \\
\hline
\end{tabular}

\section*{Function}

The Get**Clk instruction outputs a clock pulse at the specified cycle.
The clock pulse period is \(100 \mathrm{us}, 1 \mathrm{~ms}, 10 \mathrm{~ms}, 20 \mathrm{~ms}, 100 \mathrm{~ms}, 1 \mathrm{~s}\), or 1 min .
The name of the instruction is determined by the period of the clock pulse. For example, if the period of the clock pulse is 10 ms , the instruction name is Get10msClk.
The following example is for the Get1sClk instruction.

\section*{Precautions for Correct Use}
- When the instruction is executed, the first value of Out may be TRUE or it may be FALSE.
- If this instruction is used in a ladder diagram, the value of Out changes to FALSE if an error occurs in the previous instruction on the rung.

\section*{Get＊＊Cnt}

The Get＊＊Cnt instruction gets the values of free－running counters of the specified cycle．
\begin{tabular}{|c|c|c|c|c|}
\hline Instruction & Name & FB／FUN & Graphic expression & ST expression \\
\hline Get＊＊Cnt & Get Incrementing Free－running Counter Group & FUN & ＂＊＊＂must be \(100 \mathrm{~ns}, 1 \mathrm{us}, 1 \mathrm{~ms}, 10 \mathrm{~ms}\) ， 100 ms ，or 1 s ． & \begin{tabular}{l}

\end{aligned}
\] & 号 & －1 & 먹 &  \\
\hline Out & & & & & & & & & OK & & & & & & & & & & & \\
\hline
\end{tabular}

\section*{Function}

The Get＊＊Cnt instruction gets the values of free－running counters of the specified cycle．
A free－running counter is a counter that is incremented at a specific period．Out is the current value of the count．The counter period is \(100 \mathrm{~ns}, 1 \mathrm{us}, 1 \mathrm{~ms}, 10 \mathrm{~ms}, 100 \mathrm{~ms}\) ，or 1 s ．
The name of the instruction is determined by counter period．For example，if the counter period is 10 ms ，the instruction name is Get10msCnt．
The following example is for the Get1sCnt instruction．

\section*{Precautions for Correct Use}
- Free-running counters start counting as soon as the power supply is turned ON. When the count exceeds the valid range of ULINT data (18,446,744,073,709,551,615), it returns to 0 and counting continues.
- This instruction only gets the current value of the free-running counter. It does not reset the counter to 0 .
- The first value of Out cannot be predicted. It will not necessarily start from 0 .

\section*{A-1 Error Codes Related to Instructions}

Error codes are assigned to the errors that can occur when instructions are executed. If an instruction has an ErrorID output variable, the value of the ErrorID gives you the error code. However, you cannot get the error codes for instructions that do not have an ErrorID output variable. The following table, however, gives all of the error codes that can occur for instruction execution. Use this table together with the information in A-2 Error Code Descriptions and A-3 Error Code Details.
\begin{tabular}{|c|c|c|c|}

\section*{A-2 Error Code Descriptions}

The following table gives the error name, meaning, and assumed cause for each error code. Refer to A-3 Error Code Details for details.
\begin{tabular}{|c|c|c|c|c|}
\hline Error code & Name & Meaning & Assumed cause & Reference \\
\hline 16\#0400 & Input Value Out of Range & An input parameter for an instruction exceeded the valid range for an input variable. Or, division by an integer of 0 occurred in division or remainder calculations. & - An input parameter for an instruction exceeded the valid range for an input variable. Or, division by an integer of 0 occurred in division or remainder calculations. & page A-25 \\
\hline 16\#0401 & Input Mismatch & The relationship for the instruction input parameters did not meet required conditions. Or, a numeric value during or after instruction execution did not meet conditions. & \begin{tabular}{l}
- The relationship for an input parameter did not meet required conditions. \\
- A value when processing an instruction or in the result does not meet the conditions.
\end{tabular} & page A-25 \\
\hline 16\#0402 & Floating-point Error & Non-numeric data was input for a floating-point number input parameter to an instruction. & - Non-numeric data was input for a floatingpoint number input parameter to an instruction. & page A-25 \\
\hline 16\#0403 & BCD Error & \(A\) value that was not \(B C D\) was input for a BCD input parameter to an instruction. & - A hexadecimal digit of \(A, B, C, D, E\), or \(F\) was input for a BCD input parameter to an instruction. & page A-26 \\
\hline 16\#0404 & Signed BCD Error & An illegal value was input for the most significant digit for a signed BCD input parameter to an instruction. & \begin{tabular}{l}
- An illegal value was input for the most significant digit for a signed BCD input parameter to an instruction. \\
- The most-significant digit was 2 to F when _BCDO was specified as the BCD format. \\
- The most-significant digit was \(\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}\), or E when _BCD2 was specified as the BCD format. \\
- The most-significant digit was \(\mathrm{B}, \mathrm{C}, \mathrm{D}\), or E when _BCD3 was specified as the BCD format.
\end{tabular} & page A-26 \\
\hline 16\#0405 & Illegal Bit Position Specified & The bit position specified for an instruction was illegal. & - The bit position specified for an instruction exceeds the data range. & page A-26 \\
\hline 16\#0406 & Illegal Data Position Specified & The data position specified for an instruction exceeded the data area range. & - The data position or data size specified for an instruction exceeded the data area range. & page A-27 \\
\hline 16\#0407 & Data Range Exceeded & The results of instruction processing exceeded the data area range of the output parameter. & - The results of instruction processing, such as the number of array elements, exceeded the data area range of the output parameter. & page A-27 \\
\hline 16\#0409 & No Errors to Clear & An instruction to clear a Controller error was executed when there was no error in the Controller. & - An instruction to clear a Controller error was executed when there was no error in the Controller. & page A-27 \\
\hline 16\#040B & No User Errors to Clear & An instruction to clear userdefined errors was executed when there was no user-defined error. & - An instruction to clear user-defined errors was executed when there was no userdefined error. & page A-28 \\
\hline 16\#040C & Limit Exceeded for User-defined Errors & An attempt was made to use the Create Userdefined Error instruction to create more than the maximum number of userdefined errors. & - An attempt was made to use the Create User-defined Error instruction to create more than the maximum number of userdefined errors. & page A-28 \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|c|c|}
\hline Error code & Name & Meaning & Assumed cause & Reference \\
\hline 16\＃040D & Illegal Unit Speci－ fied & The Unit specified for an instruction does not exist． & \begin{tabular}{l}
－A Unit that does not exist in the Unit configu－ ration information was specified． \\
－A Unit that is in the Unit configuration infor－ mation was specified，but the Units does not actually exist in the Controller．
\end{tabular} & page A－28 \\
\hline 16\＃040F & Unit Restart Failed & Restarting a Special I／O Unit or CPU Bus Unit failed． & －The Special I／O Unit or CPU Bus Unit is pro－ cessing data． & page A－29 \\
\hline 16\＃0410 & Text String Format Error & The text string input to an instruction is not correct． & \begin{tabular}{l}
－The text string that is input to the instruction for conversion to a number does not repre－ sent a number or it does not represent a positive number． \\
－The input text string does not end in NULL．
\end{tabular} & page A－29 \\
\hline 16\＃0411 & Illegal Program Specified & The program specified for an instruction does not exist． & －The program specified by the function does not exist（e．g．，it was deleted）． & page A－29 \\
\hline 16\＃0413 & Undefined CJ－ series Memory Address & The required specification is missing for a variable for which CJ－series Unit mem－ ory must be specified． & －The required AT specification is missing for a variable for which CJ－series Unit memory must be specified． & page A－30 \\
\hline 16\＃0414 & Stack Underflow & There is no data in a stack． & －An attempt was made to read data from a stack that contains no data． & page A－30 \\
\hline 16\＃0416 & Illegal Number of Array Elements or Dimensions & The valid range was exceeded for the number of array elements or dimen－ sions in an array I／O param－ eter for an instruction． & －The valid range was exceeded for the num－ ber of array elements or dimensions in an array I／O parameter for an instruction． & page A－30 \\
\hline 16\＃0417 & Specified Task Does Not Exist & The task specified for the instruction does not exist． & －The specified task does not exist． & page A－30 \\
\hline 16\＃0418 & Unallowed Task Specification & An unallowed task was specified for an instruction． & －The local task，the primary periodic task，or a periodic task was specified． & page A－31 \\
\hline 16\＃0419 & Incorrect Data Type & A data type that cannot be used for an instruction is specified for an input or in－ out variable． & －A data type that cannot be used for an instruction is specified for an input or in－out variable． & page A－31 \\
\hline 16\＃041A & Multi－execution of Instructions & Multi－execution was speci－ fied for an instruction that does not support it． & －Execution of an instruction that does not support multi－execution of instructions was specified more than once． & page A－31 \\
\hline 16\＃0800 & FINS Error & An error occurred when a FINS command was sent or received． & －An error occurred when a FINS command was sent or received． & page A－32 \\
\hline 16\＃0801 & FINS Port Already in Use & The FINS port is being used． & －The FINS port is being used． & page A－32 \\
\hline 16\＃0C00 & Illegal Serial Com－ munications Mode & The Serial Communica－ tions Unit is not in the serial communications mode required to execute an instruction． & －The serial communications port for the Serial Communications Unit is not set to the mode expected by the instruction． & page A－32 \\
\hline 16\＃0C02 & Port Setup Already Busy & A Change Port Setup instruction was executed during execution of another Change Port Setup instruc－ tion． & －A Change Port Setup instruction was exe－ cuted during execution of another Change Port Setup instruction． & page A－33 \\
\hline 16\＃1400 & SD Memory Card Access Failure & SD Memory Card access failed when an instruction was executed． & \begin{tabular}{l}
－An SD Memory Card is either not inserted or is not inserted properly． \\
－The SD Memory Card is broken． \\
－The SD Memory Card slot is broken．
\end{tabular} & page A－33 \\
\hline 16\＃1401 & SD Memory Card Write－protected & An attempt was made to write to a write－protected SD Memory Card when an instruction was executed． & －An attempt was made to write to a write－pro－ tected SD Memory Card． & page A－33 \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|c|c|}
\hline Error code & Name & Meaning & Assumed cause & Reference \\
\hline 16\#1402 & SD Memory Card Insufficient Capacity & The capacity of the SD Memory Card was insufficient when writing to the SD Memory Card for an instruction. & - The SD Memory Card has run out of free space. & page A-34 \\
\hline 16\#1403 & File Does Not Exist & The file specified for an instruction does not exist. & - The specified file does not exist. & page A-34 \\
\hline 16\#1404 & Too Many Files/ Directories & The maximum number of files/directories was exceeded when creating a file/directory for an instruction. & - The number of files or directories exceeded the maximum number. & page A-34 \\
\hline 16\#1405 & File Already in Use & A file specified for an instruction cannot be accessed because it is already being used. & - An instruction attempted to read or write a file already being accessed by another instruction. & page A-35 \\
\hline 16\#1406 & Open Mode Mismatch & A file operation for an instruction was inconsistent with the open mode of the file. & - The file open mode specified by the Open File instruction does not match the file operation attempted by a subsequent SD Memory Card instruction. & page A-35 \\
\hline 16\#1407 & Offset Out of Range & Access to the address is not possible for the offset specified for an instruction. & - An attempt was made to access beyond the size of the file. & page A-35 \\
\hline 16\#1408 & Directory Not Empty & A directory was not empty when the Delete Directory instruction was executed or when an attempt was made to change the directory name. & \begin{tabular}{l}
- A directory was not empty when the Delete Directory instruction was executed. \\
- A directory contained another directory when an attempt was made to change the directory name.
\end{tabular} & page A-36 \\
\hline 16\#1409 & That File Name Already Exists & An instruction could not be executed because the file name specified for the instruction already exists. & - A file already exists with the same name as the name specified for the instruction to create. & page A-36 \\
\hline 16\#140A & Write Access Denied & An attempt was made to write to a write-protected file or directory when an instruction was executed. & - The file or directory specified for the instruction to write is write-protected. & page A-36 \\
\hline 16\#140B & Too Many Files Open & The maximum number of open files was exceeded when opening a file for an instruction. & - The maximum number of open files was exceeded when opening a file for an instruction. & page A-37 \\
\hline 16\#140C & Directory Does Not Exist & The directory specified for an instruction does not exist. & - The directory specified for an instruction does not exist. & page A-37 \\
\hline 16\#140D & File or Directory Name Is Too Long & The file name or directory name that was specified for an instruction is too long. & - The file name or directory name that was specified for the instruction to create is too long. & page A-37 \\

\section*{A-3 Error Code Details}

This appendix provides detailed information on error codes.

\section*{Error Descriptions}

The items that are used to describe individual errors are described in the following copy of an error table.
\begin{tabular}{l|l|l|l|l|l}
\hline Name & Gives the name of the error. & Error code & Gives the code of the error. \\
\hline Meaning & Gives a short description of the error. & \\
\hline Effects & User program & \begin{tabular}{l} 
Tells what will \\
happen to execu- \\
tion of the user \\
program.
\end{tabular} & Operation & \begin{tabular}{l} 
Provides special information on the operation that results \\
from the error.
\end{tabular} \\
\hline \begin{tabular}{l} 
System-defined \\
variables
\end{tabular} & Variable & Data type & Name \\
\cline { 2 - 5 } & \begin{tabular}{l} 
Lists the variable names, data types, and meanings for system-defined variables that provide direct error notification, \\
that are directly affected by the error, or that contain settings that cause the error.
\end{tabular} \\
\hline \begin{tabular}{l} 
Cause and \\
correction
\end{tabular} & Assumed cause & Correction & Prevention \\
\cline { 2 - 5 } & Lists the possible causes, corrections, and preventive measures for the error. \\
\hline \begin{tabular}{l} 
Precautions/ \\
Remarks
\end{tabular} & Provides precautions, restrictions, and supplemental information. \\
\hline
\end{tabular}
* One of the following:

Continues: Execution of the user program will continue.
Stops: Execution of the user program stops.
Starts: Execution of the user program starts.
\begin{tabular}{l|l|l|l|l}
\hline Name & \multicolumn{3}{|l|}{ Input Value Out of Range } & Error code \\
\hline Meaning & \multicolumn{3}{|l|}{\begin{tabular}{l} 
An input parameter for an instruction exceeded the valid range for an input variable. Or, division by an integer of 0 \\
occurred in division or remainder calculations.
\end{tabular}} \\
\hline Effects & User program & Continues. & Operation & \begin{tabular}{l} 
The relevant instruction will end according to specifica- \\
tions.
\end{tabular} \\
\hline \begin{tabular}{l} 
System-defined \\
variables
\end{tabular} & Variable & Data type & Name \\
\hline & None & --- & --- \\
\hline \begin{tabular}{l} 
Cause and \\
correction
\end{tabular} & Assumed cause & Correction & Prevention \\
\cline { 2 - 5 } & \begin{tabular}{l} 
An input parameter for an instruction \\
exceeded the valid range for an input \\
variable. Or, division by an integer of \\
0 occurred in division or remainder \\
calculations.
\end{tabular} & \begin{tabular}{l} 
Check the valid range for the input \\
variables of the instruction. Make sure \\
the input parameters are within the \\
valid range and that no division by 0 \\
or remainder calculation for 0 is per- \\
formed.
\end{tabular} & \begin{tabular}{l} 
Set the value of the input parameter \\
to the instruction so that the input \\
range is not exceeded.
\end{tabular} \\
\hline \begin{tabular}{l} 
Precautions/ \\
Remarks
\end{tabular} & None & \\
\hline
\end{tabular}
\begin{tabular}{l|l|l|l|l|l}
\hline Name & \multicolumn{3}{|l|}{ Input Mismatch } & Error code & \(16 \# 0401\) \\
\hline Meaning & \begin{tabular}{l} 
The relationship for the instruction input parameters did not meet required conditions. Or, a numeric value during or \\
after instruction execution did not meet conditions.
\end{tabular} \\
\hline Effects & User program & Continues. & Operation & \begin{tabular}{l} 
The relevant instruction will end according to specifica- \\
tions.
\end{tabular} \\
\hline \begin{tabular}{l}

\hline \begin{tabular}{l} 
Cause and \\
correction
\end{tabular} & Assumed cause & Correction & Prevention \\
\cline { 2 - 5 } & \begin{tabular}{l} 
The relationship for an input parame- \\
ter did not meet required conditions.
\end{tabular} & \begin{tabular}{l} 
Check the meaning and the relation- \\
ship of the input variables of the \\
instruction. Correct them so that the \\
relationships for the input parameters \\
meet the required conditions.
\end{tabular} & \begin{tabular}{l} 
Set the input parameter to the instruc- \\
tion so that the value meets the condi- \\
tions of the relationship for the input \\
variables.
\end{tabular} \\
& & \begin{tabular}{l} 
A value when processing an instruc- \\
tion or in the result does not meet the \\
conditions.
\end{tabular} \begin{tabular}{l} 
Check the execution process of the \\
instruction. Set the value of the input \\
parameter so that it does not cause \\
inappropriate processing results.
\end{tabular} & \begin{tabular}{l} 
Check the execution process of the \\
instruction. Set the input parameter \\
so that it does not cause this error \\
during processing.
\end{tabular} \\
\hline \begin{tabular}{l} 
Precautions/ \\
Remarks
\end{tabular} & None & \\
\hline
\end{tabular}
\begin{tabular}{l|l|l|l|l|l}
\hline Name & \multicolumn{3}{|l|}{ Floating-point Error } & Error code & \(16 \# 0402\) \\
\hline Meaning & Non-numeric data was input for a floating-point number input parameter to an instruction. \\
\hline Effects & User program & Continues. & Operation & \begin{tabular}{l} 
The relevant instruction will end according to specifica- \\
tions.
\end{tabular} \\

\section*{A-4 SDO Abort Codes}

As reference information, the following table lists the SDO abort codes for EtherCAT communications. The abort codes that are used in actual communications are specified by the slaves. Refer to the slave manuals when programming communications.
\begin{tabular}{l|l}
\hline \multicolumn{1}{c|}{ Value } & \\
\hline \(16 \# 05030000\) & Toggle bit not changed \\
\hline \(16 \# 05040000\) & SDO protocol timeout \\
\hline \(16 \# 05040001\) & Client/Server command specifier not valid or unknown \\
\hline \(16 \# 05040005\) & Out of memory \\
\hline \(16 \# 06010000\) & Unsupported access to an object \\
\hline \(16 \# 06010001\) & Attempt to read to a write only object \\
\hline \(16 \# 06010002\) & Attempt to write to a read only object \\
\hline \(16 \# 06020000\) & The object does not exist in the object directory \\
\hline \(16 \# 06040041\) & The object cannot be mapped into the PDO \\
\hline \(16 \# 06040042\) & The number and length of the objects to be mapped would exceed the PDO \\
\hline \(16 \# 06040043\) & length \\
\hline \(16 \# 06040047\) & General parameter incompatibility reason \\
\hline \(16 \# 06060000\) & General internal incompatibility in the device \\
\hline \(16 \# 06070010\) & Access failed due to a hardware error \\
\hline \(16 \# 06070012\) & Data type does not match, length of service parameter does not match \\
\hline \(16 \# 06070013\) & Data type does not match, length of service parameter too high \\
\hline \(16 \# 06090011\) & Data type does not match, length of service parameter too low \\
\hline \(16 \# 06090030\) & Subindex does not exist \\
\hline \(16 \# 06090031\) & Value range of parameter exceeded (only for write access) \\
\hline \(16 \# 06090032\) & Value of parameter written too high \\
\hline \(16 \# 06090036\) & Value of parameter written too low \\
\hline \(16 \# 08000000\) & Maximum value is less than minimum value \\
\hline \(16 \# 08000020\) & General error \\
\hline \(16 \# 08000021\) & Data cannot be transferred or stored to the application \\
\hline \(16 \# 08000022\) & Data cannot be transferred or stored to the application because of local control \\
\hline \(16 \# 08000023\) & Data cannot be transferred or stored to the application because of the present \\
device state \\
\hline & Object dictionary dynamic generation failed or no object dictionary is present \\
\hline

Cat. No. W502-E1-01```

[^0]:    * If upward differentiation (@) is specified as an instruction option, the execution condition is when the value of $E N$ changes from FALSE to TRUE. If downward differentiation (\%) is specified as an instruction option, the execution condition is when the value of $E N$ changes from TRUE to FALSE.

[^1]:    * ENO is TRUE only while the execution condition is met. The value of ENO changes to FALSE when the execution condition is no longer met after a normal end.
    - Most FUN instructions and FB instructions have ENO output variables. There are, however, some instructions that do not have an ENO output variable.
    - Omit the ENO output variable in structured text. The ENO output variable is not required in structured text because the execution condition for the next instruction is determined by the operation sequence.

[^2]:    *1 The value of Error changes to FALSE when the execution condition is no longer met after an error end.
    *2 If the execution condition is no longer met when an error end occurs, the value of Error is TRUE for one task period and it then changes to FALSE.

[^3]:    * If you omit the input parameter that connects to $I n N$, the default value is not applied, and a building error will occur. For example, if N is 3 and the input parameters that connect to $\ln 1$ and $\ln 2$ are omitted, the default values are applied, but if the input parameter that connects to In3 is omitted, a building error will occur.

[^4]:    * If you omit an input parameter, the default value is not applied. A building error will occur.

[^5]:    - If this instruction is in a master control region and the master control region is reset, the timer is reset. The value of $E T$ changes to 0 and the value of $Q$ changes to FALSE.

[^6]:    * Negative numbers are excluded.

[^7]:    * Any blank characters (' ') at the beginning of the text string, any zeros at the beginning of the text string, and any underbars (' $\quad$ ') in the text string are not included in the number of bytes.

[^8]:    * RngLowLmt must be less than RngUpLmt.

[^9]:    In＝abc＝INT\＃－128，L＝def＝UINT\＃8，Fill＝ghi＝＿BLANK
    Out $=\mathrm{jkl}$ FFFFFFFF 810

[^10]:    * If you omit the input parameter, the default value is not applied. A building error will occur.

[^11]:    * If you omit the input parameter, the default value is not applied. A building error will occur.

[^12]:    IF (Current_speed > Max_speed) THEN
    TraceTrig(USINT\#1);
    END_IF;

[^13]:    LD
    

    ST

    CIPRead_instance(A, cip_h, ‘abc[3]', UINT\#4, def[10], ghi, jkl, mno, pqr, stu, vwx);

[^14]:    * If you omit an input parameter, the default value is not applied. A building error will occur.

[^15]:    ＊You cannot specify a STRING array．

[^16]:    - An error occurs in the following cases. Error will change to TRUE.

[^17]:    * You cannot specify a STRING array.

[^18]:    * A hop is routing between the sending node and receiving node. For example, if the route path is 02\192.168.250.2\01<br>\#00, the message is first routed to the node with an IP address of 192.168.250.2 to send the message to unit address 00 . This involves one hop.

[^19]:    * A hop is routing between the sending node and receiving node. For example, if the route path is 02\192.168.250.2\01<br>\#00, the message is first routed to the node with an IP address of 192.168.250.2 to send the message to unit address 00 . This involves one hop.
